PREFACE.

THIS key is intended chiefly for the use of inquirers who have very little knowledge of botany.

The plan, that has been followed, is to classify all plants according to such characteristics as are obvious to all. Amateur botanists often complain of the difficulty they find in tracing out any plant in an ordinary Flora; it is with the hope of assisting such persons that this book has been compiled. It has been the intention of the author to use as few technical terms as possible.

The area, dealt with, is bounded on the north and north-east by the snow line of the Himalaya, on the east and south-east by the Jumna, on the south by Central India and Scinde, and the west and north-west by Afghanistan and Baluchistan. The North-West Frontier Province has been included, because it was considered as forming part of the Punjab, and until a short time ago the districts across the Indus were part of the Punjab.

Kashmir was included as it is impossible to form a satisfactory boundary in that direction, the greater number of the plants found in Kashmir grow in other parts of the Himalaya that are situated in the Punjab.

This little book is not intended to take the place of a complete Flora, but to be used as a guide in helping to identify with but little difficulty any plant in the area. Each plant is supplied with a short description consisting of the principal characters differentiating it from other plants.

This book forms an abbreviated Flora of the area, as in it is included probably every plant, excepting Grasses and Ferns, that has been found in the area. A large proportion of the plants have been examined by the author while they were still fresh.

He is much indebted to such works as the Flora of British India, the Flora of the Upper Gangetic Plain, the Flora Simlensis, the Forest Flora of the School Circle, United Provinces, and the Dictionary of Economic Productions for the descriptions and uses of plants with which he is unacquainted.

This is a suitable opportunity for thanking friends for the assistance which they have given to one, who has but a superficial knowledge of the science of botany. Mr. I. K. Kaul kindly took the photographs which have been used to illustrate the text. My thanks are due to the Bombay Natural History Society for allowing me to publish that portion of this book which I supplied to its Journal.

C. J. BAMBER,

Colonel, Indian Medical Service.

SEP 9 1929

INTRODUCTION.

THE method of classification that has been adopted in this work is the division of all flowering plants except grasses into erect plants, consisting of trees, shrubs and herbs; climbing plants; prostrate plants, that lie on the ground; water plants, which grow in water and are descended from land plants as they possess flowers which require wind or insects for their fertilization; leafless plants, which include many parasites.

Where it has proved necessary, the above classes have been sub-divided again into those plants with opposite and those with alternate leaves, these again have been separated into those with stipules (stipulate) and those without stipules (exstipulate) and these still further sub-divided into those with simple, those with lobed, and those with compound leaves.

Even these divisions are not sufficient to differentiate every single plant, it has therefore proved a necessity to supply a short description. The descriptions are arranged according to the sequence of the natural orders in Bentham and Hooker's *Genera Plantarum*.

Under the botanical name of each plant are the English and Urdu names, if any are known, then follows a reference to the page and volume of the *Flora of British India* where the full description of the plant will be found, to this has been added the habitat of the plant and its uses.

In cases where plants comply sometimes with the characteristics of one class and at other times with those of another the plant has been described in one class and merely a cross reference given in the other. Such cases occur among plants, which may be at some elevations trees, and at others merely shrubs.

Plants, which are commonly found to have established themselves as escapes or to be cultivated, but are not indigenous in the area, have been entered here.

It is essential to have good sight or to use a magnifying glass in examining plants; this is especially necessary in noting the presence or absence of stipules, as they are often very minute. Young shoots should always be selected in examining the leaves for stipules, as in many plants the stipules wither and fall off, while the leaves are still young. In identifying herbs the whole plant should be examined, as the character of the portion underground is of importance in the process of identification.

GLOSSARY.

Achene.—The closed fruit-like seed of the Compositæ.

Alternate.—When a leaf has no leaf at the same level on the opposite side of the stem or branch it is called Alternate.

Anther.—See Stamen.

Berry.—A fruit fleshy or pulpy throughout surrounded by a skin with the seeds immersed in the pulp.

Bipinnate.—When the secondary as well as the primary divisions of a leaf are pinnate.

Bract.—A scale more or less leaflike situated below the calyx of a flower or collection of flowers.

Bracteole.—The bract, which is nearest to the flowers.

Calyx.—The outer envelope of the flower, where there are two dissimilar envelopes.

Capsule.—A dry seed vessel (fruit) consisting of one or more parts (carpels).

Carpel.—One of the component parts of a fruit or seed vessel.

Climbers.—Plants which throw their weight upon external supports and grow fast, as they do not require to form the fibres for an erect stem.

Compound.—Applied to a leaf when it is divided into one or more leaflets jointed on to one stalk.

Cone.—The compound fruit of *Pinus* and other plants of the coniferæ (cone bearers).

Corolla.—The inner envelope of the flower, where there are two dissimilar envelopes, usually the most showy part : it may consist of separate petals or united portions (corolla).

Dentate.—Toothed as the margin of a leaf, notched with small triangular processes.

Digitate.—A compound leaf is digitate when it has several leaflets radiating from the extremity of the leaf stalk.

Drupe.—A fleshy fruit having a stone enclosing the seed or kernel.

Epiphyte.—A plant growing upon another without drawing nourishment from it.

Erect.—Applied to plants which have stems that support their weight without external support.

Exstipulate.—Having no stipules, see Stipules.

Folicle.—A several-seeded carpel splitting open along one side only.

Fruit.—The seed vessel of any plant, edible or inedible.

Head.—A collection of small flowers sessile on one base, looking like one flower as in theandelion or daisy.

Herb.—A plant which possesses very little woody stem above ground and usually dies down in the autumn or after flowering, and is annual or perennial.

Keel.—The two more or less combined petals, forming together an angle as in the Pea.

Lanceolate.—Of leaves nearly ovate, but tapering to both ends, and broadest below the middle.

Leaflets.—The articulated (jointed) primary divisions of a pinnate compound leaf and the secondary divisions of a bipinnate leaf.

Ligulate.—Strap-shaped.

Linear.—Narrow with almost parallel edges.

Lobe.—The division of a leaf, of a leaflet or of a petal.

Nut.—A large one-seeded unopening dry fruit.

Nutlet.—A small one-seeded dry unopening fruit, or one of the divisions of the fruit of the Boraginaceæ or Labiatae.

Opposite.—When a leaf has one or more leaves at the same level and usually on the opposite side of the branch.

Ovate.—Egg-shaped.

Palmate.—Lobed in the shape of a hand.

Pappus.—The calyx of the Compositæ, formed of hairs, bristles or scales.

Parasite.—A plant that grows upon another and derives its nourishment from it.

Perianth.—The floral envelopes—corolla and calyx, but often used to denote the floral envelope, when the flower possesses only one.

Petate.—Applied to a leaf when its stalk (petiole) is within the margin.

Petals.—The parts of the corolla.

Pinnate.—Compound leaves with leaflets arranged like the pinnules of a feather along both sides and at the end of a common stalk are styled pinnate.

Pinnule or Pinna.—One of the primary divisions of a bipinnate leaf.

Raceme.—A collection of flowers, nearly equally stalked and arranged singly along a common stalk.

Rhizome.—A creeping, generally underground, stem giving off erect stems at intervals.

Sepals.—The parts of a calyx.

Sessile.—Stalkless.

Shrub.—A woody perennial plant of not more than 30 feet in height and much branched down to the level of the ground; this includes undershrubs.

Simple.—Applied to leaves which are undivided.

Spathe.—A spike of flowers enclosed in a leafy bract (spathe).

Spathe.—A leafy bract enclosing a spike of flowers.

Spathulate.—Applied to a leaf that is oblong and tapers down into a stalk.

Spike.—A collection of sessile flowers on a common simple or branched stalk.

Spine.—A sharp woody outgrowth.

Spurred.—Having a hollow tubular projection.

Stamens.—The male organs consisting of a thread (filament) with a head (anther) containing pollen found within the petals in the flower centre.

Stigma.—See Style.

Stipules.—Bract-like growths at the base of some leaf stalks, sometimes leafy or spinous. Stipulate having stipules.

Stipels.—Secondary stipules, at the base of the leaflets of compound leaves.

Style.—One or more thread-like processes in the centre of the flower with a single or divided head (stigma).

Tendril.—A twining organ by means of which some plants climb.

Tree.—A perennial plant with a woody stem which branches out above and generally grows to more than 30 feet in height.

Tube.—The united part of the calyx or corolla.

Tuber.—An underground fleshy stem.

Unarmed.—Destitute of spines or prickles.

Winged.—Supplied with a leafy or membranous expansion.

Plants of the Punjab.

ERECT PLANTS.

TREES.

TREES WITH OPPOSITE STIPULATE SIMPLE LEAVES.

PETALS UNUNITED.

Euonymus tingens, see Trees, Opposite, Exstipulate, Simple.

PETALS UNITED.

Stephegyne or Mitragyna parvifolia, medium size, trunk buttressed ; leaves 2-6 in. diam.,
Kaēm. leathery, variable in shape, ovate or round, tip short-
RUBIACEÆ. or long-pointed, stipules pale, membranous, large, soon
F. B. I. iii. 25. falling off ; flowers white, or light yellow, very small, in
The Plains to 4,000 ft. round heads 1 in. diam., corolla trumpet-shaped, lobes
Rohtak. 5, stamens 5, on the throat of the corolla ; capsule $\frac{1}{8}$
in., 100-150 in each head, seeds many, winged, minute.

Wendlandia exserta, small, young shoots grey woolly ; leaves 5-9 in.
RUBIACEÆ. long, grey woolly on under surface, stipules recurved ;
F. B. I. iii. 37. flowers small, white, fragrant, in dense terminal branch-
Himalaya up to ing racemes, calyx lobes 4-5, persistent, corolla funnel-
4,000 ft. shaped, lobes 4-5, stamens 4-5 ; fruit dry, woolly, round,
Sutlej Valley (Collett). seeds minute, many.

Randia dumetorum, see Shrubs, Opposite, Stipulate, Simple.

Morinda tinctoria, small, branches 4-angled, woolly ; leaves 4-8 in.
Al, ach. long, pointed at both ends, woolly on both surfaces,
RUBIACEÆ. stipules sheathing with divided points ; flowers in round
F. B. I. iii. 156. heads, white, corolla about 1 in. long, lobes 4-7, stamens
The Plains, east of 4-7 ; fruit, 1 in. diam., composed of many drupes joined
the Sutlej river. together.

Ficus hispida, see Shrubs, Opposite, Stipulate, Simple.

COMPOUND LEAVES.

Staphylea Emodi, small, bark spotted and streaked ; leaves long
Nagdaun, marchob. stalked, pinnate, two lateral leaflets sessile, terminal
SAPINDACEÆ. one stalked ; flowers white, in long hanging racemes,
F. B. I. i. 698. sepals and petals alike, white, 5, erect, stamens 5 ;
Himalaya, 6-9,000 ft. capsule dry, papery, 2-3 in. long, 3-lobed and 3 pointed
Narkunda (Collett). at the top.

TREES WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

COMPOUND LEAVES.

- Dolichandrone stipulata**, large, branchlets and flowering parts covered with easily separating yellow or brown wool; leaves 1-1½ ft. long, leaflets 3-5 pairs; flowers 2-3 in. long, yellow brown, woolly, calyx cleft on one side to the base, corolla tubular, stamens 4, in two pairs facing each other; capsule 18-24 in. by 1 in., very woolly.
 BIGNONIACEÆ.
 F. B. I. iv. 379.
 The Plains.
 Gujranwala, planted.

PETALS UNUNITED.

- Euonymus tingens**, small; leaves thick, leathery, 1-3 in. long; flowers ½ in. diam., yellowish white with purple veins, calyx lobes 5, fringed, petals 5, stamens 5; fruit is a capsule, 4- or 5-lobed, opening to show a red interior in which the seeds are embedded; the capsule is angled. The inner bark yields a yellow dye. The English representative of this genus is *Euonymus Europæus*, Spindle Tree, usually a shrub.
 CELASTRACEÆ.
 F. B. I. i. 610.
 Himalaya, 6-10,000 ft.
 Simla (Collett).

- Acer oblongum**, Maple, large; leaves smooth, oblong, 3-6 by 1-2 in. long, pointed, upper surface dark green, lower white; flowers in terminal or leaf-bearing lateral clusters, sepals and petals 5, $\frac{1}{10}$ in. long, stamens 8, smooth; fruit winged, back of wing straight.
 SAPINDACEÆ.
 F. B. I. i. 693.
 Himalaya, 2-6,000 ft.
 Simla, the Glen (Collett).

- Acer lævigatum**, large; leaves smooth, oblong, 2½-5 by 1-2 in., lower surface green; flowers in loose terminal branching racemes, sepals and petals 5, stamens 5-8, smooth; fruit winged, wings reddish, back curved.
 SAPINDACEÆ.
 F. B. I. i. 693.
 Himalaya, 5-9,000 ft.

- Psidium guyava**, small, bark smooth, pinkish, peeling off in flakes; leaves 3-4 in. long, ovate, principal nerves prominent; flowers large, white, petals ununited, calyx 4-5-lobed, stamens many; fruit 2-3½ in. diam., rough skinned, succulent, edible, in the centre a mass of pulp in which many small seeds are embedded, strongly scented, a great favourite raw or cooked.
 GUAVA, *Amrut*.
 MYRTACEÆ.
 F. B. I. ii. 468.
 The Plains to 2,000 ft.
 Baluchistan.

- Eugenia Jambolana**, large; leaves smooth, shining leathery, 3-6 in. long, covered with minute shining dots; flowers pale green, ¼-½ in. long, crowded in small round clusters, calyx tube funnel-shaped, petals united into a hood, stamens in several series; fruit succulent, edible, dark purple when ripe, stone one. It is used in Indian medicine.
 JAMAN.
 MYRTACEÆ.
 F. B. I. ii. 499.
 The Plains to 5,000 ft.
 Baluchistan.

TREES WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

PETALS UNUNITED.

**Lagerstroemia
parviflora,***Bakli, dhaura.*

LYTHRACEÆ.

F. B. I. ii. 575.

The Plains to 1,000 ft.

small, bark ash coloured or light brown, smooth, peeling off in flakes ; leaves 2-3½ in. long, smooth ; flowers ¼ in. across, white, fragrant, sepals 6, petals 6, narrow with a wavy margin, long-stalked, wrinkled, stamens very many and long ; capsule attached to woody calyx ¾-1 in. long, seeds many, winged at the top, ½ in. long.

Lagerstroemia**Flos-Reginæ,***Jarul.*

LYTHRACEÆ.

F. B. I. ii. 577.

The Plains.

large ; leaves 4-8 in. long, spines sometimes on the trunks and branches of old trees ; flowers 2-3 in. across, mauve, petals long-stalked, wavy ; capsule 1½ in. long, seeds winged.

Cornus macrophylla,*Haleo, kasir.*

CORNACEÆ.

F. B. I. ii. 744.

Himalaya, 4-8,000 ft.

Simla (Collett).

large, bark brown, rough ; leaves, sometimes a few alternate, 6-4 in. long, long-pointed ; flowers small, in bunches, often 4-5 in. diam., calyx covered with white hairs, petals 3-4, ¼ in. long, strap-shaped, stamens 4 ; fruit round, ⅙ in. diam., crowned with the remains of the cup-shaped calyx.

Cornus oblonga,*Kagshi, bakar.*

CORNACEÆ.

F. B. I. ii. 744.

Himalaya, 4-7,000 ft.

Simla (Collett).

small, bark reddish brown, rough ; leaves, sometimes a few alternate, 2-6 by ¾-1½ in., narrowly oblong ; flowers as above ; fruit ovoid, ¼ in. diam., crowned as above.

Cornus capitata,**The Strawberry Tree,***Tharwar, thesi.*

CORNACEÆ.

F. B. I. ii. 745.

Himalaya, 4-7,000 ft.

Simla (Collett).

small, bark greyish brown, young branches and leaves rough with short close clinging two-pointed hairs ; leaves opposite, 2-3½ by 1¼ 1½ in., oblong or ovate ; flowers in heads rounded ½ in. diam. with four yellowish white bracts 1 by ¼ in., petal-like, calyx teeth 4, reflexed, petals 4, stamens 4 ; fruit a depressed round strawberry-like head of many minute drupes, one seeded, edible.

PETALS UNITED.

Olea cuspidata,**The Olive,***Kahu.*

OLEACEÆ.

F. B. I. ii. 611.

Himalaya, 2-6,000 ft.

Baluchistan

(Boissier).

Rawalpindi.

Salt Range.

small, bark thin, peeling in narrow strips when old ; leaves 2-4 in. long, leathery, oblong, tip hard, acute, smooth, shining above, covered beneath by minute red scales ; flowers small, white, in numerous short branching racemes in the axils of leaves, corolla rotate, deeply divided, tube short, lobes 4, stamens 2 ; drupe ¼-½ in. long, ovoid, black when ripe, stone hard, one seeded.

TREES WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

- Olea glandulifera*,** medium size, bark rough, branches with lentil-shaped corky excrescences; leaves ovate, 4-5 by $1\frac{1}{2}$ in., long-pointed, glands on the under surface; flowers cream coloured in terminal or lateral branching racemes 2-3 in. long, corolla deeply divided; drupe $\frac{1}{3}$ - $\frac{1}{2}$ in. long, ovoid, acute at the top, black when ripe, stone as the last.
Gulili, phalsh.
 OLEACEÆ.
 F. B. I. iii. 611.
 Himalaya, 2-6,000 ft.

large, branchlets 4-angled, felted with star-shaped hairs; leaves 12 by 8 in., wedge-shaped at both ends, felted beneath, ovate, stalk 1 in. long; flowers whitish blue, small, numerous in terminal branching racemes 18 in. diam., calyx small, large in fruit, corolla $\frac{1}{5}$ in. long, 5-lobed; drupe $\frac{2}{3}$ in. diam., hairy, 4-celled, bony. A fine timber tree.

Gmelina arborea,
Kumhar.
 VERBENACEÆ.
 F. B. I. iv. 581.
 The Plains to 2,000 ft.

large, bark grey, smooth, peeling in flakes, branchlets with white specks; leaves 4-8 by 3-6 in., broad, ovate, hollowed at the base, pointed, velvety beneath, stalk 3-6 in. long; flowers 1-1 $\frac{1}{2}$ in. long, tubular, 2-lipped, brownish yellow in terminal branching racemes, calyx $\frac{1}{5}$ in., corolla lobes 5-4, stamens 4; drupe ovoid, $\frac{3}{4}$ -1 in. long, skin leathery yellow, succulent, edible, stone 2-4-celled, seeds oblong. The bark and seeds are used medicinally.

PETALS NONE.

Cinnamomun Tamala,
Dalchini.
 LAURINACEÆ,
 F. B. I. v. 128.
 Himalaya, 3-5,000 ft.

leaves both opposite and alternate, sometimes on the same twig, 4-6 by 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ in., smooth, shining above, pointed, pink when young; flowers white, $\frac{1}{5}$ - $\frac{1}{4}$ in. long, in branching racemes, as long as the leaves, calyx lobes 6, unequal, silky, petals none, stamens 9 in 3 series; drupe $\frac{1}{2}$ in. long, ovoid, succulent, black when ripe, supported by the thickened stalk and 6-toothed calyx. The bark is used instead of true cinnamon.

Elæagnus hortensis,

see Trees, Alternate, Exstipulate, Simple.

Buxus sempervirens,

see Shrubs, Opposite, Exstipulate, Simple.

Cupressus torulosa,
Cypress,
Devidar.
 CONIFERÆ.
 F. B. I. v. 645.
 Himalaya,
 5,500-8,000 ft.

large with pyramidal crown and drooping branchlets, branches spreading, outline of tree narrowly conical; leaves scale-like, triangular, overlapping, catkins terminal, cylindrical, with opposite target-shaped scales with 2-6 anther scales near the edge; fruit round, head of scales closed, open when ripe, seeds $\frac{1}{6}$ in., with round wing.

TREES WITH OPPOSITE EXSTIPULATE LOBED LEAVES.

PETALS UNUNITED.

Acer caesium,
SAPINDACEÆ.
F. B. I. i. 695.
Himalaya, 7-10,000 ft. large; leaves 5-lobed, palmate, $3\frac{1}{2}$ -7 by 4-8 in., stalks $2\frac{1}{2}$ -6 $\frac{1}{2}$ in. long; flowers in long bunches arranged along a stalk which is nearly as long as the leaves and appear after them, male and female on different trees, petals small, cream coloured.

Acer villosum,
SAPINDACEÆ.
F. B. I. i. 695.
Himalaya, 7-9,000 ft. large; leaves 5-lobed, $3\frac{1}{2}$ -10 in. diam., stalks 2-5 in.; flowers in long bunches, branched and hairy, and appearing before leaves and shorter than the leaves, petals 5, short, white; fruit with wings slightly curved.

Acer caudatum,
SAPINDACEÆ.
F. B. I. i. 695.
Himalaya, 7-11,000 ft. large; leaves 5-lobed, lobes narrowed into long tail-like tips; flowers on short-stalked bunches and appearing with the leaves, sepals oblong, whitish, petals shorter than sepals, stamens 4-6; fruit smooth, wings pink, back moderately curved.

Acer pictum,
Tilpattar.
SAPINDACEÆ.
F. B. I. i. 696.
Himalaya, 4-6,000 ft. small; leaves 5- to 7-lobed, $2\frac{1}{2}$ -5 $\frac{1}{2}$ by $2\frac{1}{2}$ -6 $\frac{1}{2}$ in., stalks 1-4 $\frac{1}{2}$ in., lobes lanceolate; flowers in long-stalked bunches appearing with the leaves, sepals $\frac{1}{10}$ in. long, oblong, petals equal to sepals in length, stamens 8, short; fruit differs from all the above by the wings diverging in nearly a straight line.

PETALS NONE.

Acer pentapomicum,
The Maple,
SAPINDACEÆ.
F. B. I. i. 693.
Himalaya, 3-4,000 ft. large, twigs grey or reddish; leaves 3-lobed, $1\frac{1}{2}$ -4 by $2\frac{1}{2}$ -6 in., pale on both sides, stalks $1\frac{1}{2}$ -4 in., calyx 4-5 toothed, petals none, stamens 8; fruit smooth, wings with back nearly straight.

TREES WITH OPPOSITE EXSTIPULATE COMPOUND LEAVES.

PETALS UNUNITED.

Æsculus
Hippocastanum,
Horse Chestnut,
SAPINDACEÆ.
F. B. I. i. 675.
Himalaya, 4-10,000 ft. large, bark stripping in long pieces, buds scaly; leaves digitately compound, stalks 4-6 in. long, leaflets 5-9, 8-12 by $2\frac{1}{2}$ -4 in., the middle one largest oblong, long-pointed, toothed; flowers white, 1 in. long, irregular, in small velvety clusters arranged in erect terminal pyramidal branching racemes 12-15 in. long, calyx tubular, 5-lobed, petals 4, stalked, white, yellow and red streaks, 2 petals narrow, stamens 7; capsule prickly, brown ovoid, 1-2 in. diam. with 1-3 seeds, rounded, dark brown with a greyish scar on one side.

Baluchistan

(Hughes-Buller).

medium size, trunk thick, branches few, branchlets thick, soft, bark grey, smooth at first, in age peeling in round flakes, red inside; leaves 12-18 in. long, few at the end of branches, odd pinnate, leaflets 6-8, 3-6 in. long, oblong, ovate, long-pointed; flowers $\frac{1}{10}$ in. diam., greenish-yellow, in dense branching racemes at the ends of the branches while leafless, male and female on different branches or trees, calyx 4-cleft, petals 4, in males stamens 8, in females styles 4, short, thick; drupe $\frac{1}{4}$ in. long, oblong, kidney-shaped, red when ripe, stone hard. The bark is astringent, the wood is hard, and eaten by white ants.

Moringa pterygosperma,*Horse radish tree,**Sainjna.*

MORINGÆÆ.

F. B. I. ii. 45.

The Plains to 3,000 ft.

medium size, bark corky, wood soft, fruit is hot lik horse radish; leaves 12-24 in. long, usually 3-pinnate, stalk sheathing, pinnae 8-12, leaflets 12-18, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, unevenly ovate or with broad tip, linear glands at the base; flowers 1 in. diam., white, scented, in axillary spreading branched racemes with linear bracts, sepals 5,

TREES WITH ALTERNATE EXSTIPULATE COMPOUND LEAVES.

PETALS UNUNITED.

linear-lanceolate, reflexed, petals 5, narrow at the base, broad at the tip, stamens 5 with anthers, 5 without; capsule 9-18 by $\frac{1}{3}$ in., cylindrical, hanging down, 9-ribbed, beaked, seeds many in pits, 3-angled, winged at the angles. The young root is like horse radish. Oil from the seeds is an excellent lubricant, Ben Oil.

Spondias Mangifera,
The Hog-plum tree,
Ambara, bahamb.

ANACARDIACEÆ.

sorrel,***Patwa.*

MALVACEÆ.

F. B. I. i. 340.

The Plains,
cultivated.

large, annual, smooth, stem purplish, leaves 2-3 in., wedge-shaped at the base, usually 3-5-lobed, lower leaves sometimes not lobed, lobes lanceolate or oblong, glandular beneath, toothed, stalk 2 in., reddish, stipules ½ in. long, linear, short-pointed, flowers 2½ in. diam., yellow or purple on solitary axillary short stalks, thickened at the top, bracteoles 8-12, united to the base of the calyx, calyx enlarging in fruit, sepals united below the middle into a fleshy bristly purple cap, capsule ovoid, pointed, hairy, shorter than the calyx, seeds nearly glabrous, kidney-shaped:

HERBS, ERECT, WITH ALTERNATE STIPULATE LOBED LEAVES.

PETALS UNITED.

otherwise like the last species. This plant is cultivated for the sake of the edible calyx, from which an acid jelly is prepared ; it is used as a preventive of scurvy. The stems supply a strong silky fibre.

Hibiscus ficulneus,
Dula, kapasiya.
MALVACEÆ.
F. B. I. i. 340.
The Plains.

very large, annual, branches usually covered with broad-based sharp prickles, leaves $2\frac{1}{2}$ -4 in., 5-7-lobed, with wide sinuses between the lobes, lobes broad at the tip, narrow at the base, unequally toothed, stalks $2\frac{1}{2}$ -4 in., stipules $\frac{1}{4}$ in. long, linear, hairy, soon falling off, flowers 1-2 in. diam., white with a pink centre, on stalks, half the length of the leaf stalks, the upper in a leafless raceme, bracteoles 4-6, broad, leafy, sepals united nearly entirely, tips thread-like, capsule $1\frac{1}{2}$ in. long, ovoid, felted, with a curved beak, 5-angled, sticky when young, seeds round, softly hairy ; otherwise like the last species. This plant is often cultivated and supplies an excellent white fibre, the seeds are put into sweetmeats.

Hibiscus pungens,
MALVACEÆ.
F. B. I. i. 341.
Himalaya,
2-5,000 ft.
(Duthie).

medium size, annual or perennial, branches bristly and dotted, leaves 5-8 in., heart-shaped, 7-lobed, lobes linear-lanceolate, long-pointed, deeply toothed, upper 3-lobed, stalk longer than the blade, stipules broadly lanceolate, upper ones linear, flowers 5 in. diam., yellow with a purple centre drooping on racemose stalks 1-2 in. long, bracteoles 1 in., enlarging in fruit, calyx 5-toothed, staminal column with anthers all the way up, capsule $\frac{3}{4}$ in. long, slender, hairy ; otherwise like the last species.

Hibiscus
Abelmoschus,
Musk mallow,
Mushk dana, kasturi
bhendi.
MALVACEÆ.
F. B. I. i. 342.
The Plains.

large, annual, hairy, branched ; leaves heart-shaped, ovate or usually 3-7-lobed, lobes oblong-lanceolate, short- or long-pointed, coarsely toothed, hairy above or below, stalk longer than the blade, stipule : small, awl-shaped, flowers 3-4 in. diam., yellow with a crimson centre, solitary often apparently terminal on stout curved stalks, bracteoles 6-12, linear, ununited, hairy, much shorter than the calyx, sepals united except the 5 tips, split down on one side, capsule $2\frac{1}{2}$ -3 in., ovate, short-pointed, hairy, seeds kidney-shaped, with a musky scent ; otherwise like the last species. Musk is obtained from this plant and it also yields a strong fibre, it is, therefore, widely cultivated.

HERBS, ERECT, WITH ALTERNATE STIPULATE LOBED LEAVES.

PETALS UNITED.

- Hibiscus canceilatus**, large, annual, bristly, root spindle-shaped, leaves 4-6 in., bluntly 5-angled, or rounded, round-toothed, hairy, upper leaves with angular lobes at the base, stalks 4 in., stipules linear, flowers 4-5 in. diam., drooping, yellow with a purple centre on stalks much shorter than the leaf-stalks, racemed at the ends of branches, bracts 2 at the base of each stalk, awl-shaped, bracteoles 10-18, $1\frac{1}{2}$ in. long, linear, bristly, incurved, capsule ovoid, furrowed, very hairy, equal in length to the bracteoles, seeds many, kidney-shaped, black, not musky; otherwise like the last species.

(Hughes-Buller).
Cultivated.

small, annual, softly velvety, branching from the base; leaves terminating in a bristle, stipules almost lobed at the base, leaflets 8-12, entire, lanceolate, often tipped with a small sharp point, sessile; flowers pale purple in 2-4-flowered racemes on stalks equal to the leaves, the end of the stalk extending beyond the flowers, calyx teeth linear, silky, petals 5, standard broad, wings joined to the keel, shorter than the wings, stamens 10, united into a tube with an oblique mouth, style abruptly bent, bearded on its inner face; pod $\frac{1}{2}$ in. long, oblong, flattened, smooth, seeds 2, grey, with minute spots, flattened. The seed is much eaten, the young pod also as a vegetable, the dry leaves and stalks are used as fodder.

Jurinea ceratocarpa, see Herbs, Unbranched, Alternate, Exstipulate, Simple.

Jurinea modesta, see Herbs, Erect, Alternate, Exstipulate, Simple, Entire.

Serratula paliida, see Herbs, Unbranched, Alternate, Exstipulate, Simple.

Tricholepis furcata large, perennial, smooth, or nearly so, branched from the base, branches long, ending in a long-stalked head; COMPOSITÆ.
F. B. I. iii. 380. leaves 2-6 by $1\frac{1}{2}$ - $2\frac{1}{2}$ in., oblong with rounded ends or lanceolate, short- or long-pointed, shortly toothed, surface covered with raised points, shortly stalked; flowers $\frac{3}{4}$ -1 in. long, yellow, in nodding heads, $1\frac{1}{2}$ in. diam., bracts of heads needle or thread-like from lanceolate base, turned back, hairy, tips black, pappus hairs scaly, 1 in. long, united, bristles on floor of head shorter than the achenes, corollas 5-lobed, anther bases nearly entire, hardly forked, style arms slender; achenes $\frac{1}{5}$ in., narrowly oblong, ribbed, smooth, flattened.

Tricholepis elongata, like the last species, but sparingly branched, leaves COMPOSITÆ.
F. B. I. iii. 380. smaller, often lobed, heads nearly erect, corollas $\frac{1}{2}$ - $\frac{2}{3}$ in., bristles of the floor of the head longer than the achenes, pappus hairs $\frac{1}{4}$ in., pale brown, shining, achenes acutely 5-angled, pale.
Himalaya, 4-8,000 ft.
Simla (Collett).

Tricholepis Stewartii, like the last species, but leaves smaller, lanceolate, COMPOSITÆ.
F. B. I. iii. 380. long-pointed, quite smooth, heads 1 in. diam., shortly stalked, pappus $\frac{1}{3}$ in., stiff.
Jhelum Valley
(Stewart).

Tricholepis tibetica, see Herbs, Erect, Alternate, Exstipulate, Lobed.

Carthamus tinctorius,
Safflower,
Kasumbha, kusum.
COMPOSITÆ.
F. B. I. iii. 386.
The Plains to
2,000 ft.

medium size, annual, smooth or velvety, thistle-like ; leaves $1\frac{3}{4}$ -3 by $\frac{1}{2}$ - $1\frac{1}{4}$ in., lanceolate, stiff, toothed and spinous or entire, sessile ; flowers small, orange-red, in terminal heads $\frac{1}{2}$ -1 in. diam., bracts of heads many, spinous, erect, outer leaf-like, spinous or not, inner ovate-oblong, short-pointed, floor of head flat, densely bristly, pappus none, corollas all tubular, deeply 5-toothed, slender, anther-bases forked, tails short fringed ; achenes ovoid with top broad, 4-angled, smooth, with 4 bosses at the top. This plant is found as an escape, widely cultivated as a winter crop ; the flowers provide rouge, a beautiful pink dye and oil is obtained from the seeds.

Carthamus oxyacantha,
Kantiari, poli.
COMPOSITÆ.
F. B. I. iii. 386.
The Plains,
west of the Ravi.
Gujar Khan (Douie).
Rawalpindi.
Baluchistan (Lace).

medium size, annual, stem and branches white, leaves oblong or oblong-lanceolate, lower shortly spinous-toothed, upper half stem-clasping, very spinous, flowers orange-yellow, outer bracts of head longer than the flowers, white below the contracted portion, green above it, with yellow spines ; for other characters see the last species. This plant may be the wild form of the last species. An illuminating oil is expressed from the seeds.

Carthamus lanatus, see Herbs, Erect, Alternate, Exstipulate, Lobed.

INNER FLOWERS TUBULAR, OUTER LIGULATE.

Myriactis nepalensis,
COMPOSITÆ.
F. B. I. iii. 247.
Himalaya,
4-10,000 ft.
Simla (Collett).
Kashmir.

medium size to large, annual, velvety or roughly hairy, much branched ; leaves 1-3 in., lanceolate, shortly stalked, stalks winged ; flowers minute, outer white, inner yellow, in heads $\frac{1}{8}$ - $\frac{1}{2}$ in. diam., in clusters on diverging stalks, bracts of heads in 3-4 series, short-pointed, narrow, margins thin, afterwards reflexed, floor of heads convex, broad, naked, pappus none, corollas, inner 4-5-toothed, outer entire, short, anther-bases entire, style-arms narrow, flattened, lanceolate ; achenes flat, smooth, margined.

HERBS, ERECT WITH ALTERNATE EXSTIPULATE SIMPLE LEAVES.

LEAF MARGINS TOOTHED.

PETALS UNITED.

FLOWERS, MINUTE, IN HEADS, INNER TUBULAR, OUTER LIGULATE.

Myriactis Wallichii, very like the last species, but more slender, less hairy,
COMPOSITÆ. heads smaller on slender stalks.

Carum Carui,

Caraway,

Zira siyah.

UMBELLIFERÆ.

F. B. I. ii. 680.

Kashmir,

9-12,000 ft.

medium size, smooth; leaves twice pinnate, ultimate segments of the lower leaves lanceolate, $\frac{1}{8}$ - $\frac{1}{6}$ in., of the upper linear, $\frac{1}{4}$ -1 in.; flowers minute, white, in compound umbels, rays 3-8, $\frac{1}{4}$ -2 in., unequal, bracts 1-3, small, linear, or none, rarely divided, bracteoles small, linear or none, calyx-teeth 5, small, or none, petals 5, notched, often enlarged and irregular; fruit $\frac{1}{8}$ - $\frac{1}{6}$ in., yellowish-brown, ovoid or oblong, sticky, laterally flattened, carpels rounded, narrowed upwards, primary ridges thin but very distinct, oil gland solitary, rather large; seeds dorsally somewhat flattened, smooth or slightly grooved on the inner face. This plant is often cultivated; the seed is used as a spice, and medicinally as a carminative in flatulent colic.

Carum

Bulbocastanum,

UMBELLIFERÆ.

F. B. I. ii. 681.

Kashmir,

6-9,000 ft.

Baluchistan

(C. B. Clarke).

like the last species, but stem shorter, root tuberous, ultimate segments of all leaves linear, twice as many rays, fruit oblong, not narrowed upwards.

Carum

Roxburghianum,

Ajmud.

UMBELLIFERÆ.

F. B. I. ii. 682.

The Plains.

like the last species, but root spindle-shaped, stem larger, ultimate segments of leaves narrowly linear-lanceolate, bracteoles 4-8, linear-lanceolate with thin bristly margins; fruit hairy. This plant is only known in its cultivated form, though it is very like *Carum stictocarpum*, which grows wild in Dehra Dun outside this area. The seed is used to flavour curries and as medicine in hiccup and vomiting.

Carum copticum,

Bishop's weed,

Ajwain.

UMBELLIFERÆ.

F. B. I. ii. 682.

The Plains

Baluchistan (Lace).

medium size, annual, root spindle-shaped, ultimate segments of leaves linear, often $\frac{1}{2}$ -1 in. long, flowers pure white, bracts many, linear, sometimes divided, bracteoles 3-5, small, linear, rays velvety, fruit $\frac{1}{12}$ in., ovoid, rough with hard tubercles, carpels dorsally flattened, ridges distinct, oil gland solitary, small; for other characters see the last species. Widely cultivated, only known wild as an escape: seeds are used as a spice. Onum water is the distilled water of the seeds, also thymol: the former is used in cholera, the latter is a strong antiseptic, and cure for hookworm disease.

Himalaya,

6-9,000 ft.

Simla, Mahasu,

Hattu (Collett).

large, perennial, smooth, few leaved above; leaves 8-10 by 3 in., 1-3 pinnate, pinnæ 1-1 $\frac{1}{2}$ in., deeply divided; flowers white, in compound umbels, on long stalks, bracts 1-5, $\frac{1}{4}$ in., linear, rays 12-20 $\frac{1}{2}$ -1 $\frac{1}{2}$ in., bracteoles 4-8, $\frac{1}{6}$ - $\frac{1}{4}$ in., linear, calyx-teeth none; fruit smooth, ovate, flattened, hardly $\frac{1}{8}$ in. long, ridges all winged, lateral broadest.

Selinum tenuifolium,

UMBELLIFERÆ.

F. B. I. ii. 700.

Himalaya,

6-13,000 ft.

Mahasu, Matiana,

Shali, Hattu

(Collett).

large, perennial, stems finely grooved, hollow; leaves lower often 12 in. diam., 3-pinnate, tertiary pinnæ deeply and finely divided; flowers white, in compound umbels, rays many, hairy, bracts 4-8, $\frac{3}{4}$ -1 $\frac{1}{2}$ in., linear, often toothed or lobed, bracteoles 5-12, often longer than the umbellule, white-margined, often lobed, calyx-teeth linear; fruit smooth, $\frac{1}{8}$ in., ovate or oblong, flattened ridges corky, all winged, lateral broadest.

Selinum**papyraceum,**

UMBELLIFERÆ.

F. B. I. ii. 701.

Himalaya,

8-12,000 ft.

Kashmir.

very like the last species, but the leaves are rather less divided, rays less hairy, bracteoles not white margined, fruit $\frac{1}{8}$ in., much flattened, lateral wings papery not corky.

HERBS, ERECT, WITH ALTERNATE EXSTIPULATE COMPOUND LEAVES.

PETALS UNUNITED.

FLOWERS, MINUTE, IN UMBELS.

Selinum Candollii,

UMBELLIFERÆ.

F. B. I. ii. 700.

Kashmir,

7-8,000 ft.

very like the first species, but fruit $\frac{1}{4}$ in., somewhat flattened, ridges all nearly equally winged, corky.

Selinum vaginatum,

UMBELLIFERÆ.

F. B. I. ii. 700.

Himalaya,

6-12,000 ft.

Mahasu, Hattu,

Patarnala (Collett).

like the first species, but bracts few, inconspicuous, leaves smaller, secondary pinnæ lanceolate, scarcely lobed or divided, oil glands obsolete.

Pleurospermum

Govanianum,

UMBELLIFERÆ.

F. B. I. ii. 702.

Himalaya,

10-15,000 ft.

Kashmir.

small, perennial or biennial, nearly smooth, stem thick, hollow; leaves 4-8 in., oblong, pinnate, pinnæ $\frac{1}{2}$ - $1\frac{1}{2}$ in., toothed or cut but not deeply; flowers white or purple in compound umbels, rays 1-5 in., many, bracts 1-3 in., with an oblong entire white margined sheath and limb divided, bracteoles ovate with a broad tip, toothed at the apex, embracing the round umbellule; fruit $\frac{1}{8}$ in., oblong with rounded ends, skin loose, glistening, netted, ridges winged hollow, furrows with one oil gland, lateral ridges narrowest, seeds distinctly grooved on the inner face.

Pleurospermum

Candollii,

UMBELLIFERÆ.

F. B. I. ii. 703.

Himalaya,

10-15,000 ft.

Kashmir.

very like the last species, but bracteoles entire, blunt tipped, the fruit has the lateral ridges broader and furrows with 2-3 oil glands.

Pleurospermum

angelicoides,

UMBELLIFERÆ.

F. B. I. ii. 703.

Kashmir.

large, leaves 1-2 pinnate, 12-18 in., pinnæ 3-6 in., with oblong toothed segments, bracts 5-8, $1-1\frac{3}{4}$ in., narrowly lanceolate, entire, white-margined, bracteoles 5-8, $\frac{3}{4}$ in., narrowly lanceolate, entire, rays 10-20, 1-4 in., fruit $\frac{1}{2}$ - $\frac{3}{4}$ in., lateral ridges broadest; for other characters see the first species of this genus.

HERBS, ERECT, WITH ALTERNATE EXSTIPULATE COMPOUND LEAVES.

PETALS UNUNITED.

FLOWERS, MINUTE, IN UMBELS.

**Pleurospermum
stylosum,**

UMBELLIFERÆ.

F. B. I. ii. 704.

Kashmir, Lahul,

11-12,000 ft.

large, leaves 2-pinnate, pinnae 1-3 in., often pinnately divided, segments of secondary pinnae $\frac{1}{2}$ -1 in., toothed or divided, bracts 4-6, 1-3 in., lobed or pinnately divided at the tip, rays 10-35, $1\frac{1}{2}$ -3 in., bracteoles 6-10, lanceolate, entire or divided at the tip, calyx-teeth none, style bases prominent, ridges nearly equal, hardly winged, skin loose wrinkled; for other characters see the last species.

**Pleurospermum
densiflorum,**

UMBELLIFERÆ.

F. B. I. ii. 706.

Himalaya, Kashmir,

11-14,000 ft.

small, leaves 3-4 in., 3-4-pinnate, ovate, ultimate segments linear or linear-lanceolate, bracts 5-6, 1-2 in., oblong, tips pinnate or divided, rays 5-12, 1-2 in., bracteoles 5-8, oblong, white-margined, entire, or divided at the tip, fruit $\frac{1}{5}$ - $\frac{1}{4}$ in., ridges 5, nearly equal, broad, dorsal 1-vittate, lateral furrows with 2 oil glands, seed grooved on the inner face; for other characters see the last species.

**Pleurospermum
Brunonis,**

UMBELLIFERÆ.

F. B. I. ii. 706.

Himalaya,

9-14,000 ft.

Kashmir.

very like the last species, but fruit smaller, $\frac{1}{8}$ - $\frac{1}{6}$ in., furrows all 1-vittate, seed plane on the inner face.

**Angelica glauca,
Chura.**

UMBELLIFERÆ.

F. B. I. ii. 706.

Himalaya,

8-10,000 ft.

Narkanda, Hattu

(Collett).

Kashmir.

large, annual or biennial, smooth, root aromatic; leaves 1-2-3-pinnate, leaflets few, 1-3 in., ovate, toothed, waxy greenish-blue beneath; flowers white or purple in compound umbels, bracts several, 1 in., linear, bracteoles many, $\frac{1}{4}$ in., calyx-teeth none, petals notched, ovate with a broad tip, rays 20-30, 1-3 in., fruit $\frac{1}{2}$ by $\frac{1}{4}$ in., flattened, lateral ridges broadly winged, furrows with one oil gland, seeds $\frac{1}{18}$ in. wide, hardly grooved on the inner face. This plant is used as a cure for flatulence and dyspepsia, the root is used to give food the flavour of celery.

**Archangelica
officinalis,
Angelica,**

UMBELLIFERÆ.

F. B. I. ii. 707.

Kashmir,

8-13,000 ft.

large, perennial; leaves 12-36 in., ovate, 2-3-pinnate, leaflets $1\frac{1}{2}$ -4 by $\frac{3}{4}$ -2 in., ultimate pinnae sessile, toothed, terminal often 3-lobed; flowers white, in compound umbels, bracts few, small, bracteoles many, linear, as long as the umbellule, rays 10-30, $1\frac{1}{2}$ -4 in., calyx-teeth none, petals ovate, hardly notched; fruit $\frac{1}{3}$ by $\frac{1}{6}$ in., lateral ridges usually winged, surface corky, oil glands many, small. The leaf stalks are used in confectionery and called angelica.

HERBS, ERECT, WITH ALTERNATE EXSTIPULATE COMPOUND LEAVES.

PETALS UNUNITED.

FLOWERS, MINUTE, IN UMBELS.

Ferula Thomsoni,

UMBELLIFERÆ.

F. B. I. ii. 708.

Kashmir,

5-6,000 ft.

(Thomson).

(C. B. Clarke).

large, perennial, smooth; leaves 3-pinnate, lower leaves 12-24 in., ovate, tertiary pinnæ 2 by $\frac{1}{2}$ in., nearly entire, mostly stalked, sheaths of stem leaves large with simple or almost compound umbels; flowers yellow, also in a terminal large leafless compound umbel, bracts none or small, soon falling off, bracteoles none or very small, calyx teeth none, petals ovate, blunt-tipped or notched; fruit $\frac{1}{3}$ by $\frac{1}{5}$ in., oblong, much flattened, lateral ridges winged, vittæ broad, one in the dorsal furrows.

Ferula Jäschkeana,**Asafœtida,***Hing.*

UMBELLIFERÆ.

F. B. I. ii. 708.

Kashmir,

6-12,000 ft.

Common.

Baluchistan.

like the last species, but the leaflets on the margin are round toothed. This is probably the source of asafœtida from Kashmir, the drug oozes out of incisions on the roots, it is much used as a condiment in India and as a medicine for the cure of flatulence.

Peucedanum**graveolens,****Dill,***Sowa.*

UMBELLIFERÆ.

F. B. I. ii. 709.

The Plains to

2,000 ft.

medium size, perennial, smooth, aromatic; leaves 2-3-pinnate, ultimate segments $\frac{1}{3}$ -1 in., linear; flowers yellow, in compound umbels, bracts and bracteoles none, calyx teeth none or minute, petals ovate with a broad tip, notched, styles small; fruit $\frac{1}{6}$ by $\frac{1}{12}$ in., narrowly winged, oil gland large, solitary in each furrow, seed much flattened, inner face plane. The leaves are used as a pot herb, the fruit is used as a condiment, and as a medicine, being a cure for colic.

Peucedanum**Thomsoni,**

UMBELLIFERÆ.

F. B. I. ii. 711.

Kashmir,

5-9,000 ft.

like the last species, but the stem is large, the leaves are 3-4 pinnate, ultimate segments $\frac{1}{3}$ in., ovate, deeply divided, bracts and bracteoles few, umbels large, irregular, calyx-teeth none, fruit $\frac{1}{4}$ in.

Heracleum**Thomsoni,**

UMBELLIFERÆ.

F. B. I. ii. 711.

Himalaya,

9-15,000 ft.

Kashmir, Lahul,

Spiti.

small to medium size, perennial or biennial, grey velvety; leaves 6-10 in., 2-pinnate, ovate-lanceolate, ultimate segments $\frac{1}{2}$ -1 in., pinnately divided; flowers white, in compound umbels, bracts 4-5, $\frac{1}{8}$ - $\frac{1}{4}$ in., rays 4-10, 1-2 in., bracteoles 5-8, $\frac{1}{8}$ in., ovate-lanceolate, white margined, petals ovate with a broad tip, notched, fruit $\frac{1}{6}$ - $\frac{1}{4}$ by $\frac{1}{8}$ - $\frac{1}{6}$ in., velvety, flattened, slightly winged, greenish, oil gland solitary in each furrow.

HERBS, ERECT, WITH ALTERNATE EXSTIPULATE COMPOUND LEAVES.

PETALS UNUNITED.

Heracleum
pinnatum,
UMBELLIFERÆ.
F. B. I. ii. 712.
Kashmir,
10-16,000 ft.

like the last species, but white velvety; leaves 1-pinnate, pinnæ ovate, toothed or divided, fruit $\frac{1}{4}$ - $\frac{1}{6}$ in., ovate with a broad top, rather more winged, whitish.

Heracleum
cachemiricum,
UMBELLIFERÆ.
F. B. I. ii. 712.
Himalaya,
5-8,000 ft.
Mashobra (Collett).
Murree, Kashmir.

medium size, stem leafless, leaves 2-pinnate, pinnæ 1-3 by $\frac{1}{2}$ - $\frac{1}{3}$ in., sessile, nearly blunt-tipped, slightly toothed, bracts 2-4, $\frac{1}{8}$ - $\frac{1}{4}$ in., lanceolate, rays 6-10, 1-2 in., bracteoles 5-8, $\frac{1}{6}$ in., lanceolate, fruit $\frac{1}{4}$ in., velvety, narrowly winged; for other characters see the first species.

Heracleum
canescens,
UMBELLIFERÆ.
F. B. I. ii. 713.
Himalaya,
6-8,000 ft.
Simla, Mahasu
(Collett).

medium size, stem nearly leafless upwards, white, hairy; leaves 3-12 in., 1-2-pinnate, oblong or ovate, pinnæ $\frac{1}{4}$ -3 in., ovate or oblong, short-pointed or blunt, toothed or lobed, bracts 1-4, $\frac{1}{4}$ in., linear or lanceolate, or none, rays 6-16, 1-3 in., bracteoles 4-8, $\frac{1}{4}$ in., linear or lanceolate, calyx-teeth linear, small, fruit $\frac{1}{2}$ by $\frac{1}{4}$ in., ovate with a blunt tip, broadly winged; for other characters see the first species.

Heracleum
candicans,
UMBELLIFERÆ.
F. B. I. ii. 714.
Himalaya,
6-12,000 ft.
Simla, Mahasu,
(Collett).
Murree.

like the last species, but velvety not hairy, leaves and leaflets much larger.

Zosimla
absinthifolia,
UMBELLIFERÆ.
F. B. I. ii. 717.
Base of the Hills
west of the Indus.
Baluchistan (Lace).

medium size, perennial, velvety or hairy; leaves 4-8 in., 2-4-pinnate, velvety, oblong-lanceolate, ultimate segments $\frac{1}{4}$ - $\frac{1}{2}$ in., linear or narrowly lanceolate; flowers whitish-yellow, in compound umbels, rays 6-16, 1-3 in., often stout, bracts and bracteoles usually 5, $\frac{1}{8}$ - $\frac{1}{6}$ in., lanceolate, calyx-teeth linear, petals ovate with a broad tip, notched; fruit $\frac{1}{3}$ by $\frac{1}{4}$ in., oblong with rounded ends, flattened, lateral ridge with a thick corky blunt wing, furrows with one oil gland.

HERBS, ERECT, WITH ALTERNATE EXSTIPULATE COMPOUND LEAVES.

Primula
rotundifolia,
PRIMULACEÆ.
F. B. I. iii. 483.
Himalaya,
11-12,000 ft.
Kashmir.

small, perennial, more or less covered with yellowish-white powder, stem none, flowers on long stalks; leaves radical, 1-4½ in. diam., circular heart-shaped at the base, toothed, thin, on long stalks, 6-12 in. long; flowers ½-¾ in. diam., purple, in many-flowered umbels on long stalks from the root, bracts many, mealy, calyx 5-cleft, corolla tube twice as long as the calyx, lobes flat, forming a wheel-shaped salver, mouth ringed, lobes ovate with a broad tip, stigma round, stamens 5, within the corolla tube; capsule ¼-½ in., oblong, 5-valved, seeds ⅕ in., oblong with rounded ends, pale, rough.

Primula Clarkei,
PRIMULACEÆ.
F. B. I. iii. 484.
Kashmir,
Poosiana,
5,000 ft.
(Clarke).

like a *Viola*, small, perennial, quite smooth, rootstock woody, slender, leaves 1-1½ in., circular with hollowed base, toothed, tip rounded, thin, stalk 2-4 in., very slender, base narrowly sheathing, flowers ⅓ in., each on a separate slender stalk, the length of the leaf stalk, calyx broadly bell-shaped, lobes short, corolla tube slender, mouth not ringed, salver-shaped, lobes 2-fid, capsule round, enclosed in the calyx, seeds ¼ in. diam., nearly round, black; for other characters see the last species.

Primula denticulata,
PRIMULACEÆ.
F. B. I. iii. 485.
Himalaya,
7-13,000 ft.
Simla on Jaku
(Collott).

small, perennial, somewhat powdery or mealy-looking, rootstock short, thick, leaves 2-4 in., blunt, oblong and prolonged into a short broad stalk, waved and wrinkled, minutely toothed or sessile, enlarging after flowering, base surrounded with fleshy scales, flowers ½ in. diam., purple to lilac, crowded into a round head-like umbel, terminal on a single bare radical stalk, 4-12 in. long., corolla-tube slightly ringed, seeds coarsely rough; for other characters see the last species.

Primula sibirica,
PRIMULACEÆ.
F. B. I. iii. 487.
Kulu, Lahul,
13-15,000 ft.

small, perennial, not mealy-looking; leaves ½-1 in., ovate or oblong, prolonged into the stalk, blunt, entire or minutely round-toothed, leathery, crowded together, midrib barely visible, flowers ½-¾ in. diam., pink, in a 3-6-flowered umbel on a slender main radical stalk, 3-6 in. high, bracts erect, linear, base shortly produced, as long as the minor flower stalks, calyx tubular, ¼ in., 5-ribbed, lobes short ovate, corolla tube slightly longer than the

HERBS, UNBRANCHED, WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

calyx, mouth not ringed, lobes flat, narrow, deeply cleft, capsule cylindric, protruding from calyx, seeds $\frac{1}{40}$ in., pale, smooth, angular; for other characters see the last species.

***Primula involucrata*,**

PRIMULACEÆ.

F. B. I. iii. 488.

Himalaya,
13-15,000 ft.

Kashmir.

like the last species, but larger, leaves broader, longer stalked, main flower stalk longer, stouter, flowers white, larger, mouth of corolla tube ringed, shorter capsule, larger seeds.

***Primula elliptica*,**

PRIMULACEÆ.

F. B. I. iii. 488.

Himalaya,
8-12,000 ft.

Kashmir.

Lahul.

like *P. sibirica* above, but leaves sharply toothed, main flower stalk longer, calyx bell-shaped, deeply cleft, corolla purple, lobes broad.

***Primula rosea*,**

PRIMULACEÆ.

F. B. I. iii. 488.

Himalaya,
10-12,000 ft.

Kulu, Kashmir.

like the last species, but leaves more dense, nearly sessile, main flower stalk short, stout, corolla rose-red.

***Primula Stuartii*,**

PRIMULACEÆ.

F. B. I. iii. 490.

Himalaya,
12-16,000 ft.
Maralkund.

much larger than any of the above species, mealy or not; leaves 5-10 in., leathery, nearly erect, broadly or narrowly lanceolate with a broad tip, minutely round or sharp-toothed, mid-rib very broad, leaf stalk broad and thin below; flowers loosely umbelled, calyx teeth linear or lanceolate, corolla yellow or purple, mouth contracted, seeds very rough.

***Primula petiolaris*,**

PRIMULACEÆ.

F. B. I. iii. 493.

Himalaya,
4-12,000 ft.
Simla, Matiana,
Mahasu, Narkanda
(Collett).
Maral.

mealy or not, generally on buds; leaves 2-6 in., oblong or ovate, thin, sessile or narrowed into a winged stalk, sharply or irregularly toothed; flowers $\frac{3}{4}$ -1 in., purple to white, solitary on slender distinct radical stalks, corolla funnel-shaped, lobes toothed, sometimes rounded, mouth not ringed; capsule round, sunk in the broad calyx tube, seeds large, black, nearly round.

HERBS, UNBRANCHED, WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

Primula
minutissima,
 PRIMULACEÆ.
 F. B. I. iii. 494.
 Himalaya,
 12-15,000 ft.
 Kashmir,

very small, densely tufted, forming large patches of rosettes, each $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., leaves $\frac{1}{4}$ - $\frac{1}{2}$ in., densely crowded. dark green, lanceolate, flowers $\frac{1}{3}$ - $\frac{1}{2}$ in. diam., purple, sessile, upon a very short 1-3-flowered stalk sunk among the leaves, calyx divided to the middle, lobes oblong or lanceolate, much shorter than the corolla tube, corolla very large for the plant, lobes heart-shaped with the broad part at the tip; for other characters see *P. sibirica*.

Primula floribunda,
 PRIMULACEÆ.
 F. B. I. iii. 495.
 Himalaya,
 3-6,000 ft.
 Simla (Collett).
 Kashmir.

small, velvety-sticky, leaves $1\frac{1}{2}$ -4 by $\frac{1}{2}$ - $1\frac{1}{2}$ in., ovate, thin, narrowed into a broad winged stalk, coarsely and irregularly toothed, flowers $\frac{1}{12}$ in. diam., yellow, unequally stalked in one or several whorls, one above the other, on slender solitary or tufted main flower stalks, 4-8 in. high, corolla salver-shaped, lobes notched, tube long, mouth ringed, capsule round, enclosed in the calyx, seeds $\frac{1}{50}$ in., black angled, rough; for other characters see *P. sibirica*.

Androsace
saxifragæfolia,
 PRIMULACEÆ.
 F. B. I. iii. 496.
 The Plains to
 4,000 ft.

small, annual, velvety-sticky; leaves $\frac{1}{4}$ - $\frac{2}{3}$ in. diam., rounded, heart-shaped, round-toothed, blade and stalk of equal length; flowers small. pink to white, in umbels, surrounded with bracts, terminal on slender main stalks. bracts $\frac{1}{8}$ in., minor flower stalks $\frac{1}{4}$ - $1\frac{1}{2}$ in., very unequal, calyx deeply 5-cleft, enlarging in fruit, and spreading into a star-shape, corolla salver-shaped, tube short, 5-lobed, mouth ringed or with folds, stamens 5, enclosed in the corolla tube; capsule round, 5-valved, seeds minute, nearly round, deeply pitted.

Androsace
rotundifolia,

see Herbs, Unbranched, Alternate, Exstipulate, Lobed.

Androsace Aizoon,
 PRIMULACEÆ.
 F. B. I. iii. 497.
 Kashmir,
 8-11,000 ft.

medium size, perennial, leaves $\frac{1}{4}$ -1 in., very many, densely crowded, lanceolate, sessile, bristly, cartilaginous, flowers small, on long main flower stalks, 6-24 in. long, bracts round the umbels, $\frac{1}{10}$ in., ovate, minor flower stalks $\frac{1}{4}$ - $\frac{3}{4}$ in., very unequal, calyx top-shaped, lobes oblong, blunt, divided to the middle, corolla lobes divided with appendages also split up; capsule with 2-fid valves, seeds large, angular, rough; for other characters see the last described species.

HERBS, UNBRANCHED, WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

Androsace sempervivoides,

PRIMULACEÆ.

F. B. I. iii. 497.

Kashmir,

11,000 ft.

Sind Valley

(Collett).

like the last species, but much smaller, bearing runners, plants forming rosettes $\frac{1}{2}$ in., nearly round, runners 1-1 $\frac{1}{2}$ in., short, stout, naked; leaves $\frac{1}{4}$ - $\frac{1}{3}$ in., ovate with a broad tip, spoon-shaped thick, tip straight with short sharp point; flowers pink, small, unbelled on a solitary scape 1-3 in., bracts linear-oblong, calyx broadly top-shaped, lobes 5, erect in fruit, corolla 5-lobed, salver-shaped, lobes ovate with a broad tip, tips rounded, stamens 5, included in the tube; capsule 1-2-seeded, seeds larger, oblong, one side convex.

Erythræa**Roxburghii,***Charayatah.*

GENTIANACEÆ.

F. B. I. iv. 102.

The Plains to

2,000 ft.

small, annual or perennial; leaves radical 1 by $\frac{1}{3}$ in., ovate with a broad tip, many, persistent, stem leaves smaller, narrower; flowers $\frac{1}{4}$ in., pink, on long stalks, $\frac{1}{4}$ - $\frac{1}{2}$ in., in the forks of widely branching clusters, calyx $\frac{1}{5}$ in., tubular, teeth 5, lanceolate or linear, corolla tube longer than the calyx, lobes 5, very small, spreading, stamens 5 near the top of the corolla, short, linear, style linear, stigmas 2; capsule oblong, equal to the calyx, nearly 2-valved, 2-celled, seeds very small, net-veined. The plant is very bitter and may be used as a tonic instead of chiretta.

Erythræa Meyeri,

GENTIANACEÆ.

F. B. I. iv. 102.

Kashmir,

5-8,000 ft.

like the last species, but radical leaves few, often 2 or none, clusters not so much branched, corolla tube scarcely longer than the calyx, flowers white.

Rawalpindi (Douie)

Kashmir.

small, annual, smooth, or slightly velvety, root slender, stem 6-12 in., leafy, sometimes branched; leaves 2-6 by $\frac{1}{10}$ - $\frac{1}{4}$ in., chiefly radical, linear, gradually narrowed at both ends, quite entire; flowers yellow, all ligulate in small stalked heads $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., bracts of receptacle 5-7, narrow, nearly equal, thin, base keeled, outer very few, small, receptacle naked, corollas all ligulate, ligules 5-toothed, anther-bases forked; achenes $\frac{1}{3}$ - $\frac{2}{3}$ in. longer than the bracts, narrowly linear, incurved like birds' claws, ribbed, dorsal ribs with hooked spines, terminal spines star-shaped.

HERBS, UNBRANCHED, WITH ALTERNATE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

FLOWERS, MINUTE, IN HEADS, ALL LIGULATE.

Crepis sibirica,
COMPOSITÆ.
F. B. I. iii. 394.
Himalaya,
6-10,000 ft.
Kashmir.

small to medium size, perennial, more or less rough, root spindle-shaped, very stout, stem 6-18 in., sometimes branched; leaves 6-12 in., lowest stalked, lanceolate with a broad long-pointed tip, toothed or pinnately divided, end lobe largest, minutely toothed, stem leaves heart-shaped, half stem-clasping; flowers yellow, all strap-shaped, in few stalked heads 1 in. diam., in terminal clusters, bracts of receptacle blunt, bristly, velvety, outer broadly ovate, inner linear, pappus $\frac{1}{4}$ in., scanty, soft; achenes $\frac{1}{2}$ in., slender, ribbed, smooth, pale brown, gradually narrowed into a slender beak.

Crepis blattaroides,
Hawk's Beard,
COMPOSITÆ.
F. B. I. iii. 394.
Kashmir.
Sonemarg,
11,500 ft.

like the last species, but larger, leaves 2-4 by 1-2 in., oblong-ovate with a broad short tip, entire or toothed, stem leaves few, large, sessile, bracts of receptacle lanceolate, sharp-pointed, achenes $\frac{1}{3}$ in., red-brown, outer curved.

Crepis acaulis,
COMPOSITÆ.
F. B. I. iii. 396.
Himalaya,
east of the Chenab,
1-3,000 ft.

small, perennial, stemless, smooth, root woody, straight, cylindric; leaves chiefly radical, 2-12 in. long, lanceolate, linear, blunt or short-pointed, entire, toothed or pinnately divided; flowers yellow, in few heads, 1 in. long, 10-12-flowered on bracteolate stalks, 3-10 in., shorter than the leaves, outer bracts of receptacle very small, inner linear; achenes $\frac{1}{4}$ in., oblong with rounded ends, flattened, ribs 10-20, smooth, pappus soft, silvery, longer than the achenes.

Crepis Stoliczkai,
COMPOSITÆ.
F. B. I. iii. 396.
Himalaya,
10-13,000 ft.
Kashmir, Tilail,
Lahul.

like the last species but hairy, leaves long-stalked heads $\frac{1}{2}$ in. long, achenes $\frac{1}{6}$ in., red-brown, pappus shorter than the achenes.

HERBS, UNBRANCHED, WITH ALTERNATE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

FLOWERS, MINUTE, IN HEADS, ALL LIGULATE.

Pterotheca

Falconeri,

COMPOSITÆ.

F. B. I. iii. 399.

Himalaya,

5-9,000 ft.

Matiana, Baghi

(Collett).

Kashmir.

small to medium size; annual, stems many, rough, or glandular or smoothish; leaves radical, 2-8 in., nearly sessile, ovate with a broad tip or long and spoon-shaped, toothed or pinnately divided; flowers yellow, in heads $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., on slender stalks, bracts of receptacle velvety, inner ones 8-10, equal, linear, short-pointed, outer few, small, usually spreading, receptacle flat, hairy, ligules long, broad, spreading, 5-toothed; achenes $\frac{1}{8}$ in., linear, prominently ribbed, minutely wrinkled, narrowed to both ends, not beaked, red when ripe, pappus very short, soft, white, not feathery.

Hieracium crocatum,

Hawk's weed,

COMPOSITÆ.

F. B. I. iii. 400.

Himalaya,

west of the Sulej,

6-8,000 ft.

Dalhousie.

Kashmir.

medium size, perennial, smooth or hairy, juice milky, stem 12-24 in., straight, sometimes branched, leafy; leaves radical none, stem leaves 1-5 in., sessile, oblong with round ends, linear-oblong or lanceolate, waxy beneath, base rounded, or heart-shaped, entire or toothed; flowers yellow, in heads $\frac{3}{4}$ in. diam., few or many and erect on downy, hairy, or smooth stalks, bracts of receptacle smooth, flat-lying, blunt, outer often slender, recurved, ligules 5-toothed, long, spreading, pappus copious, rough, rigid, brittle, tawny; achenes $\frac{1}{6}$ in., cylindric, faintly ribbed, black, shining, not beaked.

Hieracium virosum,

COMPOSITÆ.

F. B. I. iii. 400.

Kashmir.

7-8,000 ft.

Srinagar.

medium size, perennial, smooth or very little hairy, waxy green, stem stout, leafy, stiff, leaves 1-3 in., sessile, short, leathery, oblong-ovate, base heart-shaped, toothed, crowded, smooth above, slightly bristly on the margins and beneath, flowers yellow, in many heads, $\frac{2}{3}$ in. diam., in short terminal bracteate umbellate flat-topped clusters, stalks short, stout, bracteolate, bracts of receptacle smooth, outermost small, spreading, achenes $\frac{1}{10}$ in., red-brown; for other characters see the last species.

Kashmir.

like the last species, but leaf narrower, flowers many in a cluster, bracts many, very short, linear, each bearing a flower or bulbil in its axil, calyx smaller, lobes linear, blunt.

Gagea reticulata,

LILIACEÆ.

F. B. I. vi. 356.

The Plains to

6,000 ft.

Salt Range,

Kashmir.

like *Gagea lutea*, but leaf grass-like, bracts several, leaf-like, very unequal, whorled, calyx lobes linear, finely pointed.

**Commelina
cœlestis,**

see Herbs, Erect, Alternate, Exstipulate, Simple,

Juncus bufonius,**The toad rush,**

JUNCACEÆ.

F. B. I. vi. 392.

The Plains to

13,000 ft.

small, annual, pale-coloured, tufted, stems 1-10 in., slender, often branching from near the base; leaves flat, few, chiefly radical, stem leaves shorter; flowers $\frac{1}{6}$ - $\frac{1}{4}$ in. long, solitary or in small clusters, sessile on the stem or branches, pale green, calyx inferior, lobes 6 in 2 rows, 3 outer lobes keeled, lanceolate, long-pointed with broad membranous margins, stamens 6, half as long as the calyx lobes; capsule oblong, minutely pointed, shorter than the calyx.

Juncus glaucus,**Hard rush,**

JUNCACEÆ.

F. B. I. vi. 393.

Himalaya,

6-9,000 ft.

Matiana, Theog

(Collett).

Kashmir.

medium size to large, perennial, rootstock creeping, tufted, stems 12-36 in., many, tufted, pale green, stiff, cylindric, finely grooved, leafless, produced beyond the flower, bases closed with a leafless sheath; leaves none or cylindric like the stems; flowers minute, brown, sessile solitary, stamens 6, shorter than the calyx lobes; capsule ovoid, pointed, equal to or rather longer than the calyx.

Juncus compressus,

JUNCACEÆ.

F. B. I. vi. 393.

Himalaya,

Kashmir.

7,000 ft.

(Jacquemont).

small to medium size, perennial, rootstock creeping, stems 6-24 in., tufted, rigid, slender, 1-2-leaved, hollow, somewhat flattened, striated; leaves shorter than the stem, slender, grooved, nearly flat, tip awl-shaped, sheath with ear-shaped processes; flowers almost solitary in terminal clusters, shorter than the thread-like lower bracts, compound, calyx lobes $1\frac{1}{2}$ in. long, linear-oblong, blunt, with green or brown thin margins about equal to the broad ovoid capsule, stamens much shorter or less than the calyx lobes; capsule 3-celled, shining, with a small point.

HERBS, UNBRANCHED, WITH ALTERNATE EXSTIPULATE SIMPLE LEAVES.

PETALS NONE.

The Plains up to
13,000 ft.
Simla (Collett).
Lahore, banks of
the Jhelum.

small, perennial, rootstock horizontal, stems 4-10 in., densely tufted, leafy upwards, rather stout, soft, ultimately hollow, rounded or flattened, leaves linear-awl-shaped, strongly partitioned, division showing externally, tubular; flowers small, sessile, 2-5-flowered, heads on branches of an umbel, lower bracts leafy, floral ovate-lanceolate, heads $\frac{1}{6}$ - $\frac{1}{4}$ in., calyx lobes $\frac{1}{8}$ in. long, green or brown, margins thin, stamens enclosed; capsule green or brown, seeds netted, not tailed.

**Juncus
prismatocarpus,**
JUNCACEÆ.

F. B. I. vi. 395.
The Plains to
10,000 ft.
Sutlej Valley,
Rampur (Collett).

medium size, perennial, tufted, rootstock very short, stems 18-24 in., rounded or flattened, sometimes lying down, rooting at the knots; leaves 2-10 by $\frac{1}{10}$ - $\frac{1}{8}$ in., thread-like or broader, soft, flattened or rounded of one or many tubes with indistinct distant partitions; flowers green or brown, sessile, densely crowned in 6-10-flowered heads forming irregularly compound flat-topped clusters, lower bracts leafy, erect, shorter than the clusters, floral thin, lanceolate, long-pointed, calyx lobes $\frac{1}{8}$ - $\frac{1}{6}$ in. long, stamens very short; capsule much longer than the calyx, prismatic or cone-shaped, seeds ovoid with a broad top or oblong with rounded ends.

Juncus triglumis,
JUNCACEÆ.

F. B. I. vi. 396.
Himalaya,
12-15,000 ft.
Kashmir.

small, perennial, tufted, stems 2-6 in., stiff, slender, naked; leaves short, solitary or few, awl-shaped, stiff near base of stem, 2-tubular; flowers large, brown sessile in a solitary terminal 3-4-flowered sessile head, no clusters, outer bracts dark brown, spreading, usually shorter than the flowers, calyx lobes $\frac{1}{6}$ - $\frac{1}{5}$ in., seeds $\frac{1}{10}$ in. long, including the long white tails.

Juncus leucomelas,
JUNCACEÆ.

F. B. I. vi. 397.
Himalaya,
12-16,000 ft.
Kashmir.

small, perennial, tufted, stem 2-6 in., thread-like, naked, hollow; leaves 1-2, very short, thread-like, 1-2-tubular; flowers white, sessile, in a 3-8-flowered head, bracts brown, lower usually produced, calyx lobes $\frac{1}{5}$ - $\frac{1}{3}$ in. long, stamens exerted; capsule ovoid-oblong, seeds long-tailed.

**Juncus
membranaceus,**
JUNCACEÆ.

F. B. I. vi. 397.
Himalaya,
6-13,000 ft.
Kashmir.

small to medium size, perennial, stems 5-20 in., tufted, ultimately hollow, bearing runners, basal sheaths membranous, 1-3-leaved above the middle; leaves thread-like, short-pointed, slender, flattish or grooved, tubular, sheath long, with ear-shaped processes; flowers white, shortly stalked in a solitary sessile head, lower bracts longer or shorter than the head, floral ovate-lanceolate, transparent,

HERBS, UNBRANCHED, WITH ALTERNATE EXSTIPULATE SIMPLE LEAVES.

PETALS NONE.

calyx lobes $\frac{1}{3}$ in. long, oblong-lanceolate, blunt, thin, inner longer, stamens 6, protruding, style and stigma short; capsule far protruding, long-beaked, seeds $\frac{1}{10}$ in. long-tailed.

Juncus himalensis,

JUNCACEÆ.

F. B. I. vi. 398.

Himalaya,

7-14,000 ft.

Hattu (Collett).

Kashmir.

small to medium size, perennial, stems 8-20 in., tall, stout, stiff, leafy below, one-leaved above, hollow, bearing runners; leaves thread-like or margins rolled inwards, tubular, grooved above, barely partitioned, ear-like processes, small; flowers $\frac{1}{3}$ in., brown, in 3-8-flowered heads forming a cluster of several heads with branches sometimes one inch long, spreading, lower bract long, floral bracts $\frac{1}{3}$ - $\frac{2}{3}$ in. diam., calyx lobes $\frac{1}{3}$ in. long, lanceolate, short-pointed, inner linear-oblong, with broad thin margins, tip longer than the stamens; capsule nearly twice as long as the calyx lobes, tip conical, beaked, shining, dark brown, seeds $\frac{1}{5}$ in. long, tails very slender.

Juncus concinnus,

JUNCACEÆ.

F. B. I. vi. 399.

Himalaya,

7-13,000 ft.

Simla (Collett).

Kashmir.

small to medium size, perennial, rootstock tuberous, stems tufted, not bearing runners, 4-18 in., hollow, furrowed, slender, more or less leafy; leaves thread-like or with margins turned in, flat or furrowed, sheath thin; flowers $\frac{1}{6}$ in., white, 10-12, in sessile heads $\frac{1}{3}$ across, sometimes solitary, usually 2-5 in the fork and at the ends of one or two short branches, spreading from the top of the stems, lowest bracts long, slender or short, thin like the floral, calyx lobes $\frac{1}{6}$ in. long, oblong-lanceolate, short-pointed, thin, inner shorter, blunt; capsule very pale, shining, ovoid, beak stout, protruding, seeds minute, long, brown, pointed at one end.

Luzula campestris,

Wood Rush,

JUNCACEÆ.

F. B. I. vi. 401.

Himalaya,

10-14,000 ft.

Kashmir.

small to medium size, perennial, grass-like, hairy, rootstock creeping, stem 6-18 in., slender, tufted; leaves 2-3 by $\frac{1}{6}$ - $\frac{1}{3}$ in., smooth or with bristles long and white, near the base of the stem; flowers minute, dark brown, sessile in stalked ovoid heads $\frac{1}{4}$ in. long in the forks and at the ends of very unequal branches of an erect terminal branching raceme, calyx lobes 6, $\frac{1}{12}$ - $\frac{1}{10}$ in. long, ovate-lanceolate, long-pointed, stamens 6, shorter than the calyx; capsule shorter than the calyx, broadly oblong or almost round, blunt or with a stiff point, seeds 3.

HERBS, UNBRANCHED, WITH ALTERNATE EXSTIPULATE SIMPLE LEAVES.

PETALS NONE.

Luzula spicata,
JUNCACEÆ.

Aconitum Napellus,
Monk's hood,
Bikh or Bish.
RANUCULACEÆ.
F. B. I. i. 28.
Himalaya,
10-13,000 ft.
east of the Sutlej.

small to large, perennial, smooth or slightly velvety ; leaves deeply palmately divided, segments linear, much divided ; flowers $\frac{3}{4}$ -1 in. long, bright or dull greenish-blue, in simple or compound few-or many-flowered racemes, bracts entire or divided into three, sepals 5, petal-like, posterior (helmet) three times as long as high, shallow, tapering to a slender beak, the rest flat, 2 anterior narrower than the lateral, petals 2-5, 2 posterior stalked, hooded, enclosed in the helmet, 3 lower small or none, stamens many ; follicles 3-5, sessile, hairy, seeds many, smooth. The root contains a deadly poison, it is used in medicine.

Aconitum
heterophyllum,

see Herbs, Erect, Alternate, Exstipulate, Lobed.

HERBS, UNBRANCHED, WITH ALTERNATE EXSTIPULATE LOBED LEAVES.

PETALS UNUNITED.

Podophyllum Emodi, small to medium size, perennial, smooth, succulent, *Papri, banbakri*. rootstock creeping, scaly, 2-leaved, flower stalk 6-18 in., leafy above; leaves 2, 6-10 in. across, circular, long stalk joined to middle of leaf, divided deeply into 3 parts, each part lobed, sharply toothed, often blotched with purple; flower solitary, rarely 2, 1½ in. diam., white, rarely pink, sepals 3-6, petal-like, soon falling off, petals 6, stamens 6, style short, stigma crest-like, ridged; berry 1-2 in., scarlet, ovoid, edible, seeds small, many, ovoid with a broad top, immersed in pulp. Closely allied to *Podophyllum peltatum*, L. May Apple—*Podophyllin*, an alkaloid extracted from the root of a *Podophyllum*, is used as a purgative.

Papaver somniferum, see Herbs, Erect, Alternate, Exstipulate, Lobed.

Meconopsis aculeata, see Herbs, Erect, Alternate, Exstipulate, Lobed.

Cardamine hirsuta, small, annual, smooth, stem 3-12 in.; leaves 2-6 in., stalked, pinnately lobed, lobes 7, of the lower leaves broadly ovate or circular with a few large, lobe-like teeth, of the uppermost often narrowly oblong, end lobe largest, blunt or rounded, stem leaves not lobed at the base; flowers $\frac{1}{10}$ in., white, in racemes, sepals 4, very small, equal at the base, petals 4, stalked, narrow, erect, twice as long as the sepals, stamens 6, 2 outer short, opposite the lateral sepals, 4 inner longer in pairs, opposite the other two sepals, stigma almost sessile; pods $\frac{1}{2}$ -1 in., erect, blunt linear, long, flat, seeds flattened, in one row, without a margin. This plant is sometimes eaten as a pot herb.

Cardamine impatiens, like the last species, but the base of the stem leaves divided with 2 long stem-clasping lobes, lobes of radical leaves 7-15, ovate, obtusely lobed, stem leaves longer, lanceolate, entire, pods pointed, when ripe they burst elastically, jerk out the seeds and curl up.

HYDROCHARITACEÆ.
 F. B. I. v. 662.
 Kashmir, in stagnant water.

WATER PLANTS.

HERBS WITH OPPOSITE EXSTIPULATE SIMPLE LEAVES.

PETALS UNITED.

- Ottelia alismoides**, medium size, submerged, roots fibrous ; leaves crowded, **HYDROCHARITACEÆ**. very variable, the submerged narrow, the floating long-stalked orbicular or oblong, heart-shaped, 2-6 by 1-2 in. or even 7 in. diam., 7-11-nerved, stalk 1-10 in. ; flowers white, solitary sessile on a tubular 2-fid sheath, sheath 1-1½ in., 5- or 6-winged, wings waved unequal, sepals 3, linear or oblong, petals 1 in. broad, stamens 6-15, styles 6, linear, 2-fid ; fruit 2 in. diam., oblong, 6-valved, enclosed in the sheath, crowned by the withered flower, 6-grooved, linear-oblong to round, seeds many, oblong.

PETALS NONE.

- Callitriche stagnalls**, small, floating, submerged, or growing on mud, stems **Water Starwort**, slender, brittle, much branched, rooting at the joints ; **HALLORRHAGIDACEÆ**. leaves ½ in. long, ovate or very narrow, entire, lower opposite, upper crowded into little rosettes ; flowers minute, axillary, usually solitary, each between two minute bracts (sometimes wanting), calyx and corolla none, in male flowers one stamen, filament long, in female flowers a 4-lobed ovary, styles 2, long, thread-like ; fruit round, flattened, sessile, margins winged, short-pointed, dividing into 4 one-seeded nuts.

- Callitriche verna**, like the last species, but the leaves are often oblong, **HALLORRHAGIDACEÆ**. fruit not winged, blunt.
F. B. I. ii. 434.
Himalaya,
5-8,000 ft.
Kashmir, 7,000 ft.
Changlagalli (Douie).

- Vallisneria spiralis**, medium size, tufted, stemless, submerged ; leaves **Sawala, syala**, 5-10 by ½ in. varying with the depth of water, linear, **HYDROCHARIDACEÆ**. translucent, green ; flowers male and female separate in sheaths, male flowers many, minute on long stalks in a 3-lobed short-stalked sheath ⅓ in., sepals 3, petals none, stamens 1-3, the sheath breaks off and floats at the surface when the anthers shed the pollen, female flower solitary in a tubular 3-toothed sheath on a long thread-like coiled stalk, sepals 3, petals none, staminodes 3, 2-fid, stigmas 3, broad, notched ; fruit linear enclosed in the sheath, seeds many. For purposes of propagation, the flower is carried to the surface by the un-coiling of the spiral stalk, after fertilization it is again submerged by the stalk coiling up again ; fruit linear, many-seeded. This plant is used similarly to *Hydrilla verticillata* in sugar refining.

Limnophila
sessiliflora,
 SCROPHULARIACEÆ.
 F. B. I. iv. 270.
 The Plains,
 in rice fields and
 marshes.

small, annual, slender, hairy, covered with glands; leaves $\frac{1}{2}$ in. long, 3-6 in a whorl, lobed or pinnately divided, upper leaves often opposite and entire; flowers $\frac{1}{2}$ in. long, blue, sessile, axillary, solitary, calyx 5-lobed nearly to the base, segments nearly equal, lanceolate, long-pointed, corolla 2-lipped, tube cylindric, upper lip erect, 2-lobed, lower spreading, 3-lobed, stamens 4, in unequal pairs, enclosed in the corolla, anther cells stalked, widely separated, style bent at the top, stigma flat, 2-lobed; capsule ovoid, seeds many, small, angular.

Limnophila
heterophylla,
 SCROPHULARIACEÆ.
 F. B. I. iv. 270.
 The Plains,
 in rice fields and
 marshes.

like the last species, but much larger, stem smooth, many, much divided leaves, calyx lobes less long-pointed.

Limnophila
gratioloides,
 SCROPHULARIACEÆ.
 F. B. I. iv. 271.
 The Plains.
 Kangra and
 Dharmasala,
 3-4,000 ft.
 Baluchistan.

small, simple or branched, smelling of turpentine, smooth, leaves $\frac{1}{4}$ - $\frac{3}{4}$ in. long, lower leaves often finely divided, flowers stalked, sometimes racemed, calyx $\frac{1}{8}$ - $\frac{1}{4}$ in., corolla $\frac{1}{2}$ in.; for other characters see the last species.

Utricularia stellaria,
 LENTIBULARIACEÆ.
 F. B. I. iv. 328.
 The Plains, in rice
 fields and marshes.

stem floating, leaves submerged; leaves much divided into hair-like segments, interspersed with bladders; flowers yellow, bracteate, stalked, 1 to 8 together, $\frac{1}{2}$ in. long on main stalks which are 2-8 in. long, standing out of the water, smooth, bearing about the middle a cluster of oblong vesicles, calyx of 2 segments, lobes entire, or nearly so, ovate, corolla $\frac{1}{4}$ in. diam., 2-lipped, upper lip entire or notched, lower larger, 3-6 lobed, spur curved, shorter than the lower lip, stamens 2, broad, anthers ovate, style short, stigma 2-lobed; capsule $\frac{1}{2}$ in., round, fruit sepals $\frac{1}{4}$ - $\frac{1}{2}$ in., seeds many, small, thickly discoid, concavo-convex caused by the turning in of the thin barely winged margin.

WATER PLANTS.

HERBS WITH OPPOSITE EXSTIPULATE LOBED LEAVES.

PETALS UNITED.

Utricularia flexuosa,
LENTIBULARIACEÆ.
F. B. I. iv. 329.
The Plains, in rice
fields and marshes.

like the last species, but generally larger, corolla $\frac{1}{2}$ - $\frac{1}{4}$ in. long, main flower stalks with only a few scales.

Utricularia exoleta,
LENTIBULARIACEÆ.
F. B. I. iv. 329.
The Plains, in rice
fields and marshes
(uncommon).

like the last species, but very much smaller, capsule much larger than the sepals, seeds with thin margin, open, nearly entire.

PETALS NONE.

Ceratophyllum demersum,
Hornwort,
CERATOPHYLLACEÆ.
F. B. I. v. 639.
The Plains to
8,000 ft., in still
water.

rootless, submerged, slender, fragile, stem 8-36 in. long, densely leafy, green; leaves 1 in. long, whorled, divided into thread-like toothed lobes, spreading in water, closing together when lifted out of the water; flowers minute, axillary, sessile, male and female flowers on the same plant, male flowers solitary, calyx of 6-12, narrow, 2-fid awl-like, segments, petals none, stamens 20-30, very short, anthers erect, with a minute float at the top to enable it to remain near the surface, pollen of the same specific gravity as the water to enable it to float about till it strikes a stigma, female with the same calyx as the male flower, no stamens, ovary sessile, ovoid, one-celled, style awl-like, stigmated surface on one side; fruit a small leathery ovoid, somewhat flattened nut with a hooked style on the top, and 2 curved spurs on each side above the base.

Najas graminea,
NAIADACEÆ.
F. B. I. vi. 569.
The Plains.

rootstock creeping, submerged, stem 1-2 ft., branched, thread-like; leaves $\frac{2}{3}$ to 1 in., narrowly linear, long-pointed, soft, sharply many-toothed, basal lobes (auricles) erect, lanceolate, toothed on both edges; flowers male and female on the same plant, minute, axillary, clustered, male flowers consist of an outer tubular or inflated tube with a thin transparent inner one, stamen one, united to the inner tube, female flowers consist of one sessile carpel with or without a transparent tube outside, stigmas 2-4, slender; achenes oblong, seed erect.

Najas minor,
NAIADACEÆ.
F. B. I. vi. 569.
The Plains,

very like the last species, but very slender, much branched, leaves less acutely toothed, less broad, less transparent, basal auricles rounded.

WATER PLANTS.

HERBS WITH ALTERNATE STIPULATE SIMPLE LEAVES.

PETALS UNUNITED.

Nymphæa alba,
Water-Lily,
Brimposh, nilofar.
 NYMPHÆACEÆ.
 F. B. I. i. 114.
 Kashmir.

large, perennial, rootstock creeping, submerged; leaves 5-10 in. diam., base heart-shaped, nearly circular, quite entire, floating, stalks long, hollow, in deep water ribbon-like, submerged leaves are sometimes found, stipules at the base of stalks; flowers 3-4 in. diam., floating, stalks long from rootstock, sepals 4, petals many, stamens many, petaloid, anthers without appendages, linear, pollen bristly, stigmas 6, forming a rosette of 6 rays in the centre of the top of the round berry $1\frac{1}{2}$ in. long in which the 16 carpels containing many minute seeds are sunk, at first the carpels sink to the bottom and ripen, then burst, the seeds first float then sink.

Nymphæa Lotus,
Chota Kanwal.
 NYMPHÆACEÆ.
 F. B. I. i. 114.
 The Plains.

like the last species, but rootstock short, erect, tuberous, leaves undulating sharp-toothed, arrow-shaped when young, flowers often pink or red, sepals blunt, ribbed, pollen smooth, anthers without appendages. The root is often eaten, and is used as a cooling medicine and demulcent.

Nymphæa stellata,
Bambher, nilpadma.
 NYMPHÆACEÆ.
 F. B. I. i. 114.
 The Plains.

like the last species, but the leaves often entire, flowers sometimes blue or purple, petals 10-30, stamens 10-30, stigmas 10-30, anthers with long appendages. The root and seeds are often eaten.

Euryale ferox,
Gorgon fruit,
Makhana, jewar.
 NYMPHÆACEÆ.
 F. B. I. i. 115.
 Kashmir.

large, perennial, densely prickly, stemless, rootstock thick, short; leaves 1-4 ft. diam., oval or circular, green above, downy reddish beneath with strong spiny ribs; flowers 1-2 in. long, partially submerged, violet inside, green and shining outside, sepals 4, erect, with recurved spines on their backs, petals 20 or so, in 3-5 series, shorter than the sepals, narrowly-ovate-oblong, stamens many, in bundles of 8, linear, stigma depressed, concave discoid; berry 2-4 in. diam., nearly round, prickly, crowned with the persistent sepals, seeds 8-20, size of a pea to a cherry, coat pulpy, skin thick, black. The seeds are roasted and eaten, and considered very digestible and very strengthening.

WATER PLANTS.

HERBS WITH ALTERNATE STIPULATE SIMPLE LEAVES.

Sacred Lotus or
Egyptian Bean,
Kanwal, pamposh.
 NYMPHÆCEÆ.
 F. B. I. i. 116.
 The Plains to
 6,000 ft.
 Kashmir.
 Pind Dadan Khan.

large, perennial, juice milky, rootstock submerged, stout, creeping; leaves 24-36 in. diam., waxy, bluish-green, cupped, thin, standing above the water, stalks 3-6 ft. long, full of spiral vessels, surface smooth or prickly, joined to the centre of leaf-blade; flowers 4-10 in. diam., white or pink, sepals 4-5, soon falling off, petals many, concave, veined, soon falling off, stamens many, soon falling off, anthers with a clubbed appendage, carpels many, sunk in spongy base of the flower, which breaks off the stalk, then floats about, finally rots and the carpels each with one seed sink to bottom of the pond and take root, styles many, stigma terminal. The rootstock is eaten; and the seed is used as a heart stimulant.

Trapa bispinosa,
Horn nut,
Singhara.
 ONAGRACEÆ or
 HYDROCARYACEÆ.
 F. B. I. ii. 590.
 The Plains, in
 stagnant waters.

medium size, perennial, floating, stem long, zigzag, submerged portion at intervals gives off much divided pairs of green organs-like stipules at the base of the old leaf scars; leaves 2 by $2\frac{1}{2}$ -3 in., floating, crowded into rosettes on the upper part of the stem, dark green, shining above, woolly beneath, tips slightly round-toothed, stalk 4-6 in. long, woolly, stipules linear, thin, soon falling off; flowers small, white, axillary, solitary, stalked, calyx tube short, 4-fid, 2 segments or all are persistent, becoming spinescent on fruit, petals 4, small, stamens 4, style awl-shaped, stigma round; fruit $1-1\frac{1}{2}$ in. long and broad, horny, ovoid with a broad top, one-celled, ripening under water, 4-angled, 2 or all spinescent with a short beak on the top for the seed radical to protrude, seed one. The plant is often cultivated in ponds, the seed is much eaten raw or cooked.

Trapa natans,
 ONAGRACEÆ or
 HYDROCARYACEÆ.
 F. B. I. ii. 590.
 Kashmir.

like the last species, but the floating leaves only 1 in. diam., tip toothed deeply, stalk 2-4 in., smooth, under surface only slightly hairy on the nerves, fruit only $\frac{3}{4}$ in., broad, all 4 angles spinescent, 2 lateral spines shorter.

(Collett).

Hattu.

perennial, pale pink, leafless, parasitic on the roots of trees, stems creeping underground, fleshy, covered with short thick scales, much branched, branches erect, aerial, 4-12 in. with a few thin scales bearing terminal racemes of flowers; flowers $\frac{3}{4}$ in., creamy white tipped with pink purple, many in bracteate racemes, lengthening and straightening as they open, calyx 2-lipped, 4-lobed, tubular, hairy, corolla 2-lipped, upper lip entire, lower 3-lobed, both lips almost erect, stamens 4, in unequal pairs, near the top of the tube, anthers slightly touching, hairy; capsule ovoid, 2-valved. The scales have small cavities lined with glands like those of insectivorous plants, remains of insects are found in these cavities, the proteid matter possibly absorbed by the glands.

Æginetia
pedunculata,

OROBANCHACEÆ.

F. B. I. iv. 320.

The Plains to

7,000 ft.

Murree.

annual, leafless, parasitic on the roots of grasses, small, 3-6 in. high, red or yellow, stem very short, $\frac{1}{4}$ in. thick, creeping underground, scapes short, stout, very fleshy; flowers $1\frac{1}{2}$ - $2\frac{1}{2}$ in. long, yellow with blue, on long slender stalks 1-4 in., at the base bracts $\frac{1}{4}$ - $\frac{1}{2}$ in., ovate, blunt, calyx spoon-shaped, split down the front, fleshy, corolla tube broad, uncurved, 2-lipped, lobes 5, broad, 2-upper united, stamens 4, unequal, style long, tip curved, stigma 2-lobed; capsule ovoid, 2-valved.

Cistanche or
Phelipæa tubulosa,

OROBANCHACEÆ.

F. B. I. iv. 324.

The Plains.

Lahore (Thomson).

annual, large, leafless, smooth or velvety, parasitic, stem 12-60 by $\frac{1}{2}$ -3 in., unbranched, scaly, scales $\frac{1}{2}$ -1 in., lanceolate; flowers $1\frac{1}{2}$ in., yellow, in crowded spikes 6-10 by 1-3 in., bracts $\frac{5}{8}$ - $\frac{7}{8}$ in., lanceolate, longer than the calyx, bracteoles linear, narrower and shorter, calyx $\frac{1}{2}$ - $\frac{3}{4}$ in., broadly tubular-bell-shaped, lobes 5, nearly equal, blunt,

LEAFLESS PLANTS.

HERBS.

PETALS UNITED.

corolla much incurved, dilated above, slender below, tube inflated, mouth $\frac{3}{4}$ - $1\frac{1}{4}$ in. diam., lobes broad, short, nearly equal, stamens 4, almost projecting from the corolla tube, hairy, anthers woolly; capsule ovoid, laterally flattened, 2-valved to the base, seeds many, almost round.

Orobanche
kashmirica,
OROBANCHACEÆ.
F. B. I. iv. 324.
Kashmir.
Tilail (Clarke).

annual, small, velvety, leafless, parasitic, pale brown, stem 12 by $\frac{1}{4}$ in., unbranched, scaly, scales $\frac{1}{4}$ - $\frac{1}{2}$ in., lanceolate, few, distant, flowers $\frac{1}{2}$ - $2\frac{2}{3}$ in., pale brown in few loose bracteate spikes, bracts $\frac{1}{4}$ - $\frac{1}{3}$ in., lanceolate, longer than the calyx, bracteoles none, calyx $\frac{1}{4}$ in., divided to the base behind, 5-toothed, teeth broad, short-pointed, corolla broad, softly velvety, tube curved, 2-lipped, upper lip erect, lower 3-lobed, lobes rounded, stamens 4 in unequal pairs, inserted at the base of the corolla tube, anthers included, spurred at the base, minutely hairy. style long, tip curved, stigma 2-lobed; capsule 2-valved, seeds very many, round.

Orobanche cernua,
OROBANCHACEÆ.
F. B. I. iv. 325.
The Plains to
12,000 ft.

like the last species, but almost smooth, flowers blue in crowded spikes, calyx lobes lanceolate, calyx divided to the base behind, almost in front, 2-lobed, 3 lower corolla lobes long-pointed, anthers long-pointed.

Orobanche borealis,
OROBANCHACEÆ.
F. B. I. iv. 325.
Himalaya,
7-8,000 ft.
Murree.

like the last species, but roughly velvety, calyx with 4 long awl-shaped teeth and a median, very small tooth.

Orobanche Solmsii,
OROBANCHACEÆ.
F. B. I. iv. 325.
Kashmir, Kishtwar,
8-11,000 ft.
(Falconer).

like the last species, but stem stouter, flower yellow not blue, calyx segments bi-fid to the middle.

LEAFLESS PLANTS.

HERBS.

PETALS UNITED.

**Orobanche
epithymum,
Red Broom Rape,**
OROBANCHACEÆ.

F. B. I. iv. 325.
Himalaya,
7-12,000 ft.
Simla, Mahasu
(Collett).
Kashmir.

like the last species, but stickily velvety, parasitic on thyme roots, stems often tuberous below, calyx divided to the base, before and behind, segments undivided, flower orange brown.

Orobanche indica,
Sarsan banda.
OROBANCHACEÆ.
F. B. I. iv. 326.
The Plains.
Thanesar.

like the last species, but parasitic on mustard roots, sometimes much branched from the base bracteoles 2, calyx divided only to the base behind, 4- or 5-toothed, corolla blue, straight. This parasite grows on the roots of mustard and tobacco plants. Cows taught to eat it give more milk.

**Orobanche ramosa,
Branched Broom
Rape,**
OROBANCHACEÆ.
F. B. I. iv. 326.
Kashmir, Jammu,
Banahal, 6-7,000 ft.

very like the last species, but parasitic on hemp and lucerne roots, calyx lobes slender, awl-shaped, from a broad base, corolla tube white, lobes blue.

Orobanche psila,
OROBANCHACEÆ.
F. B. I. iv. 327.
Kashmir at
Mapanon, 9,000 ft.
(Clarke).

like the last species, but not branched, calyx divided to the base in front and behind, segments 2-fid, lobes awl-shaped, corolla tube curved.

**Corallorhiza innata,
Spurless Coral Root,**
ORCHIDACEÆ.
F. B. I. v. 710.
Kashmir
(Jacquemont).

perennial, erect, leafless, red brown, rootstock coral-like, jointed, scape 6-10 in., slender, not branched, sheathed, sheaths loose; flowers $\frac{1}{4}$ in. long, yellowish green, few in a terminal spike, almost sessile, bracts minute, sepals 3, ovate-lanceolate, lateral deflexed, petals 3, equal to the sepals, incurved, tip hanging, united to the base of the column, 3-lobed, side lobes narrow, middle blunt, slightly notched, column short, erect, with a terminal lid-like anther, 2 pairs of round pollen masses.

LEAFLESS PLANTS.

HERBS.

PETALS UNITED.

Neottia listeroides,

ORCHIDACEÆ.

F. B. I. vi. 103.

Himalaya,

5-9,000 ft.

Simla, in forest

(Collett).

Jaku, Kashmir.

perennial, erect, leafless, brown, roots forming a dense mass of fleshy fibres growing on rotting vegetation in shade, stem unbranched with the raceme 8-14 in. high, sheathed, stout or slender, stiff, sheaths 3-4, loose; flowers $\frac{1}{2}$ in. red or brown-green in a loose flowered velvety raceme, 6-12 in., bracts $\frac{1}{6}$ - $\frac{1}{3}$ in., ovate-lanceolate, as long as or longer than the ovary, sepals 3, ovate-lanceolate, concave, erect, then spreading, petals 3, smaller, linear, blunt, then spreading, lip hanging from the base of the column, 2-3 times as long as the sepals, linear, oblong, tip broad, 2-lobed, mid-rib broad, dark green, column short, incurved, prolonged into a pointed process stretching over the stigma, 2 pairs of pollen masses hanging from the gland of the rostellum; capsule $\frac{1}{3}$ in. long, erect, narrowed at both ends, seeds minute.

Gastrodia**crobachoides,**

ORCHIDACEÆ.

F. B. I. vi. 122.

Himalaya,

7-8,000 ft.

perennial, erect, leafless, yellowish-brown, root a large oblong ringed tuber, parasitic on roots, stem 10-24 in., stout, sheaths short, loose; flowers $\frac{1}{2}$ - $\frac{2}{3}$ in., yellow, in a many-flowered loose raceme, bracts nearly as long as the flowers, oblong, short-pointed, sepals and petals united into a 5-lobed tube, split in front, lip short, united below to the column and the sepals and petals ovate recurved, column erect, nearly as long as the tube, narrowly 2-winged, stigma prominent, anther terminal; pollen masses 2; capsule $\frac{3}{4}$ in., erect, swollen.

Epipogum aphyllum,**Leafless Epipogum,**

ORCHIDACEÆ.

F. B. I. vi. 124.

Himalaya,

6-8,000 ft.

Fagu, the Chor, in forest (Collett).

perennial, leafless, rare, grows on decaying leaves, only found in Herefordshire in Britain and there on two occasions, rootstock creeping, tuberous above, branches short, fleshy, stem 4-8 in., stout, erect, sheathing, sheaths 1-2, short, blunt; flowers $\frac{3}{4}$ in., yellow pink in a 3-6 flowered terminal raceme, bracts large, shorter than the flowers, raceme thin, oblong, sepals $\frac{1}{2}$ - $\frac{3}{4}$ in., narrowly lanceolate, petals are like in size and shape to the sepals, lip above, joined to the base of the column, oblong, whitish with red glandular warts, 3-lobed, middle much the largest, pointed, recurved, concave, spur large, equal to the lip, blunt, column short, anther thickened, 2-celled, terminal, pollen masses 2, connected by slender tails to a triangular gland on the column; capsule 3-valved, seeds very many, minute.

LEAFLESS PLANTS.

HERBS.

PETALS UNITED.

Balanophora involuerata,
BALANOPHORACEÆ.
F. B. I. vi. 237.
Himalaya,
6,000 ft.
Kotgarh, Simla
Hills (Thomson)
(Collett).

smooth, fleshy, fungus-like, leafless, parasitic on the roots of trees, rootstock tuberos, 3-4 in. diam., warted, flower stems 1-6 in. long burst from the rootstock which forms a sheathed ring at the base, on the stem about the middle a ring of 2-4 scales (involucre) contain yellow or red flower heads or cones, flowers minute, interspersed with club-shaped cellular bodies (bracteoles), male flower consists of a tube (calyx) of 3 united lobes sunk in the head. stamens 3, united in a column, female flowers consist of a round flattened ovary narrowed into a slender style, sometimes clustered round a bracteole; fruit minute, brittle, seed round.

Asparagus filicinus,
Alli palli, satzarra.
LILIACEÆ.
F. B. I. vi. 314.
Himalaya,
4-7,000 ft.
Mashobra (Collett).
Kashmir.
Nathiagalli.

rootstock perennial, stout, creeping, stems annual, erect, zigzag, hollow, much branched, smooth, unarmed leafless, minute scales in their axils, tufts of 2-5 flattened curved branchlets (cladodes) $\frac{1}{3}$ - $\frac{1}{2}$ in.; flowers $\frac{1\frac{1}{2}}{1\frac{1}{10}}$ in., white, drooping, single or in pairs, stalks $\frac{1}{2}$ in., very slender, jointed about the middle, calyx bell-shaped, 6-parted, stamens 6, at the base of the calyx lobes, ovary 3-angled, 3-celled, style 1, stigmas 3; berry $\frac{1}{4}$ in. diam., round, red, seeds 2-6. The root is used as a tonic and astringent.

Asparagus gracilis,
LILIACEÆ.
F. B. I. vi. 315.
The Plains to
6,000 ft.
Valleys below Simla
(Collett).
Rawalpindi.
Baluchistan.

like the last species, but prickly on the lower branches, cladodes straight, stiff, flowers $\frac{1}{6}$ in., calyx-segments spreading.

Asparagus racemosus,
Satawar, shakakul.
LILIACEÆ.
F. B. I. vi. 316.
The Plains to
4,000 ft.
Valleys below Simla
(Collett).
Below Fagu.

like the last species, but stems climbing, prickles $\frac{1}{4}$ in., curved, round, spreading, flowers in racemes, 1-4 in. long. This plant is used as a demulcent, diuretic, alterative and antidyserteric.

LEAFLESS PLANTS.

HERBS.

PETALS UNITED.

Asparagus
adscendens,
Safed musli.

LILIACEÆ.

F. B. I. vi. 317.

The Plains to

6,000 ft.

Suni (Collett).

like the last species, but stems straggling, half climbing, prickles $\frac{1}{2}$ - $\frac{3}{4}$ in. straight cladodes erect in tufts of 6-20. The root is used as a demulcent and tonic, often instead of salep.
